MAGNETICS + MECHANICS + NANOSCALE = ELECTROMAGNETICS FUTURE

Gregory P. Carman

Univ. of California, Los Angeles (USA)

Abstract: Efficiently controlling magnetism in the small scale presents a significant problem for future miniature electromagnetic devices. In many macroscale electromagnetic systems we rely on a discovery made by Oersted 200 years ago where an electrical current through a wire creates a distributed magnetic field. While this concept works well in the large scale it suffers significant problems at volumes below 1 cubic millimeter. One approach to manipulate nanoscale magnetic states is Spin Transfer Torque STT. However, experimental measurements on STT memory devices indicates 100 fJ is required to reorient a bit of memory with an energy barrier of ~0.5aJ, i.e. 0.0005% efficiency. An efficiency of this level should be considered unacceptable and new nanoscale approaches are needed for future miniature electromagnetic devices.

Recently researchers have explored strain-mediated multiferroics to resolve this problem. For this material class a voltage-induced strain alters the magnetic anisotropy of nanoscale magnetoelastic elements. These strain mediated multiferroic composites consist of piezoelectric material coupled to nanoscale magnetoelastic elements to transfer electrical energy to magnetic energy through a mechanical transduction mechanism. The coupling coefficient (energy transferred) in piezoelectric materials (e.g. PZT) can be ~0.8 and the coupling coefficient in available magnetoelastic materials (e.g. Terfenol-D) is of similar magnitude ~0.8. Thus the amount of energy to overcome a 0.5aJ bit barrier is potentially

-0.8 aJ or an efficiency of ~60% neglecting line losses, i.e. orders of magnitude improvement compared to existing approaches.

This presentation reviews the motivation, history, and recent progress on nanoscale strain mediated multiferroics. Research descriptions include analytical and experimental work on strain mediated multiferroic thin films, single magnetic domain structures, and superparamagnetic particles. The results indicate efficiencies orders of magnitude superior to STT approaches and presents a new approach to control magnetism in the small scale. Discussions of research opportunities as well as novel applications to motivate future studies are described.

SMART MATERIALS AND STRUCTURES: OPPORTUNITIES FOR A NEW PARADIGM IN DESIGN OPTIMIZATION

Naveed Hussain

The Boeing Co. (USA)

Abstract: Future aerospace vehicles will need to meet demanding performance requirements at significantly lower cost and compressed development timeline. The use of multidisciplinary system optimization tools enabled by innovative multifunctional design concepts will play a major role in expanding the design space to meet these stringent requirements. Multifunctional concepts that integrate advanced materials, printable electronics, distributed sensing, and distributed actuation, while monitoring and reacting to vehicle health, provide opportunities for a new paradigm in design optimization. This presentation will provide motivation for the increased use of smart structures, provide a number of diverse examples where such designs are being used or considered for aerospace vehicle implementation, and recommendations for future technology development.

Biography: **Naveed Hussain** is Vice President of Aeromechanics Technology and leads the Boeing Research & Technology research center in Southern California, where he oversees a team of scientists, technologists, technicians and engineers who are responsible for integrated technology development in the areas of flight sciences and structures. Past roles include leading Platform & Networked Systems Technology for BR&T, serving as chief engineer of Network & Tactical Systems for Boeing Defense, Space, & Security, and launching the BR&T-India research center in Bangalore. USE OF THE ELASTODYNAMIC RECIPROCITY THEOREM FOR ULTRASONIC PROBLEM SOLVING

Jan D. Achenbach

Northwestern Univ. (USA)

Abstract: For linearly elastic bodies the elastodynamic reciprocity theorem is an integral relation over the interior of a region V and its boundary S , which involves the displacements, the surface tractions, and the body forces of two elastodynamic states, State A and State B. In this lecture it is shown that the theorem can be used to solve problems for guided waves, such as surface waves and waves in waveguides, which only requires the general form of the wave motion of State A, whose amplitude function is to be determined, and only the general form of State B, which is a virtual wave. Examples to be discussed are the surface wave generated by a concentrated load (Lamb's problem), the scattering of surface waves by a sub-surface crack and the scattering of torsional waves by a circumferential surface defect on a pipe.

Biography: **Jan D. Achenbach** has contributed to the theory and applications of ultrasonic methods to quantitative non-destructive evaluation, particularly the measurement of elastic properties of thin films by acoustic microscopy, and the detection of cracks and corrosion in safety-critical structures. In recent years he has been involved with the development of probabilistic methods for structural health monitoring of fatigue and corrosion damage in structural components. He is the author of a well-known book entitled *Wave Propagation in Elastic Solids* (Elsevier Science, 1973, still available in paperback), and a recent book entitled *Reciprocity in Elastodynamics* (Cambridge University Press, 2004), as well as three other books and numerous papers in technical journals. In 2003 he was awarded the 2003 National Medal of Technology, and in 2005 the National Medal of Science.

THE DARPA ATOMS TO PRODUCT PROGRAM

John A. Main

Defense Advanced Research Projects Agency (USA)

Abstract: Many materials in the nanoscale regime exhibit unique physical characteristics not found at larger scales that enable important applications. Examples of nanoscale properties of interest include quantized current-voltage behavior, dramatically lower melting points, significantly higher specific heats, enormous surface-to-volume ratios that enable rapid temperature changes, manipulated reactivity enabled by dissimilar catalytic surfaces placed in close proximity, three-to-four orders of magnitude increase in radiative heat transfer, and bandgaps/colors that change from bulk characteristics. Combinations of these properties enable new devices that are only achievable through fabrication of systems with nanoscale features. The DARPA Atoms to Product (A2P) seeks to develop technology to assemble from the nanoscale to the product or human scale, while maintaining and exploiting the unique material properties found only in the nanoscale regime.

Biography: **Dr. John A. Main** has spent his career developing new technologies and businesses. He is currently a Program Manager in the Defense Sciences Office at DARPA where he is responsible for initiating new DARPA programs in the physical sciences and fostering the R&D communities that will support those programs.

HIGH-FREQUENCY INTEGRATED PHONONIC CRYSTAL STRUCTURES

Ali Adibi

Georgia Institute of Technology (USA)

Abstract: Planar phononic crystal (PnC) structures fabricated on CMOS-compatible substrates are of great interest for several applications including wireless communications and sensing. The presence of phononic bandgap (i.e., a range of frequencies with no propagating mechanical waves) allows the realization of a large range of functional devices (e.g., waveguides, resonators, filters) by engineering the geometry of the structure. In addition, the existence of phononic bandgap in these materials enables the use of membrane-based structures (similar to MEMS-based devices) with negligible support loss. Such structures at higher frequencies (e.g. a few GHz) are of great interest for wireless communications. Several techniques for the realization of the integrated phononic crystals at high frequencies in CMOS-compatible substrates (including hole-based membranes, metallic-pillar-based membranes, and piezoelectric-pillar-based structures) will be discussed in this talk. Structures utilizing slab modes and surface acoustic waves will be discussed. Both the physical principles for the operation of the devices (e.g., physics of the formation of bandgap, guiding, and resonance mechanisms) and their implementation will be covered. Experimental evidence for the existence of the phononic bandgap in these structures and the use of their relatively wide bandgap for the implementation of practical PnC devices (especially waveguides and resonators) will be theoretically and experimentally demonstrated, and the prospects of these structures for practical applications (e.g., sensing and wireless communications) will be discussed.

Biography: **Ali Adibi** is the director of Bio and Environmental Sensing Technologies (BEST) and the Joseph M. Pettit Chair in the School of Electrical and Computer Engineering, Georgia Institute of Technology. His research group has pioneered several structures in the fields of integrated nanophotonics and phononic crystal structures for both information processing and sensing. He is the author of more than 140 journal papers and 400 conference papers. He is the editor-in-chief of the Journal of Nanophotonics, and the nanophotonic program track chair of the SPIE Photonics West meeting. He is the recipient of several awards including Presidential Early Career Award for Scientists and Engineers (PECASE), Packard Fellowship, NSF CAREER Award, and the SPIE Technology Achievement Award.

EAPAD Keynote Presentation

Monday 21 March 2016 10:30 to 11:10 AM

Location: Grand A/B

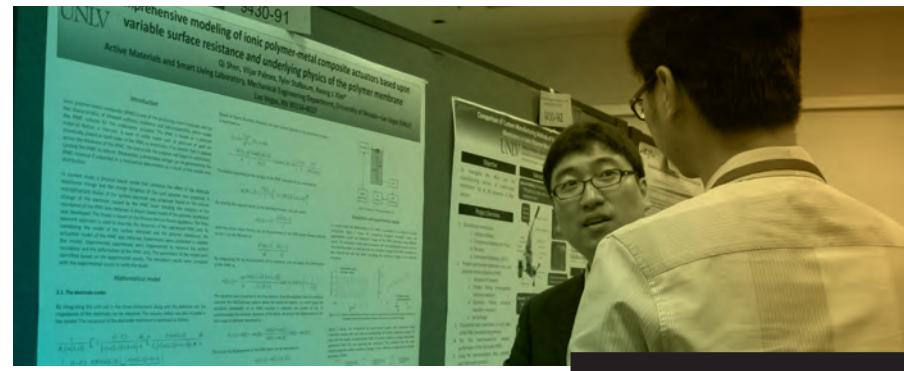

Elisabeth Smela

Univ. of Maryland, College Park (USA)

Abstract: EAP devices typically deliver either large displacements or high forces, but not both, whereas hydraulic actuators do provide both, within seconds, but they require a pressurized fluid source. By taking advantage of a micro-scale phenomenon – electro-osmotic fluid pumping – it is possible to create a new type of “nastic” EAP that is self-contained and electrically actuated. The devices are fabricated by lamination of paper and elastomer layers, and by encapsulating a fluid – propylene carbonate – that does not generate gas bubbles. Applications such as smart stents with adjustable diameters are being pursued.

Biography: **Prof. Elisabeth Smela** is a Professor in the Department of Mechanical Engineering and the Institute for Systems Research at the University of Maryland, with affiliate appointments in Materials Science and Engineering and Electrical and Computer Engineering. She received a BS in physics from MIT and a PhD in electrical engineering from the University of Pennsylvania. Following her PhD she was a postdoc and then a researcher in Linkoping, Sweden, where she began developing conjugated polymer microactuators, LEDs, and sensors, and examining the volume change mechanisms. She continued this work as a senior researcher in Riso, Denmark, before moving to studies of actuation in spun polyaniline fibers as Vice President of Research and Development at Santa Fe Science and Technology. Her research at UMD has focused on polymer and biological microsystems, included basic understanding of conjugated polymer actuators, microfabricated dielectric elastomer actuators, and nastic actuators. Her group is also working on tactile skins for co-robotics, a bio-nose on a chip based on olfactory sensory neurons, and mapping the positions of nucleic acids in tissue sections.

Course level: Introductory

CEU 0.65 \$555 SPIE Members | \$645 Non-members

Sunday, 8:30 am to 5:30 pm

NEW

The purpose of this hands-on tutorial is to expose participants to statistical and numerical techniques that will allow them to quantify the accuracy of multi-physics models and simulation codes for active materials and structures when one accounts for uncertainty or errors in models, parameters, numerical simulation codes, and data. Additionally, we will discuss global sensitivity analysis techniques for parameters, as well as uncertainty propagation techniques, and illustrate how they provide insights regarding material behavior and can be used to quantify the accuracy of predictions.

In the first part of the tutorial, we will provide an overview of Bayesian statistics, sensitivity analysis methodologies, and numerical algorithms necessary to propagate input uncertainties through simulation codes. We will consider several case studies to illustrate these techniques for a variety of materials and smart structure applications. These include models for piezoelectric macro-fiber composites, shape memory alloys, viscoelastic polymers, graphene thermoacoustics, quantum-informed ferroelectric continuum models, and Rietveld analysis. In this part of the tutorial, we will provide participants with algorithms that quantify the uncertainties in model parameters, such as piezoelectric constants, when they are calibrated from experimental data. We will show how global sensitivity analysis can be used to rank model parameters and isolate those parameters that cannot be reliably estimated from data. To illustrate the uncertainty propagation techniques, we will demonstrate the construction of 95% prediction intervals for PZT models at a given applied field. Finally, we will demonstrate, in the context of a shape memory alloy example, the manner in which robust control designs can be improved through uncertainty quantification.

In the second, hands-on, part of the tutorial, we will have participants run case studies using MATLAB. These studies will include models and data provided by the instructors, but participants are also encouraged to bring their own models and data for testing during the tutorial, based on their specific problem(s) of interest.

Course level: Introductory

CEU 0.35 \$360 SPIE Members | \$410 Non-members

Sunday, 1:30 to 5:30 pm

This course will provide an overview of the field of EAP covering the state of the art, challenges and potential. Two general classes of polymer materials are described, namely those that involve ionic mechanisms (Ionic EAP), and field activated materials (Electronic EAP). The basic mechanisms responsible for the electroactive behavior of EAP materials will be covered and compared with natural muscles. Analytical models, fabrication processes and methods of characterizing these materials will be described. Moreover, the currently considered applications will be reviewed including actuators, robotics, animatronics, energy harvesting, medical, and biologically inspired mechanisms, so called biomimetics.

The course begins with an overview of the field, current capabilities, potential and challenges. The course follows with a description of the currently available EAP materials and principles of operating them as actuators and artificial muscles. The course ends with a review of the future prospect of EAP as actuators in systems, mechanisms and smart structures for space, industrial and medical applications.

INTENDED AUDIENCE

Engineers, scientists and managers who need to understand the basic concepts of EAP, or are interested in learning, applying or engineering mechanisms or devices using EAP materials. 18th Annual EAP-in-Action Session and Demonstrations

Monday 21 March · 4:30 to 5:45 pm · Location: Grand A/B

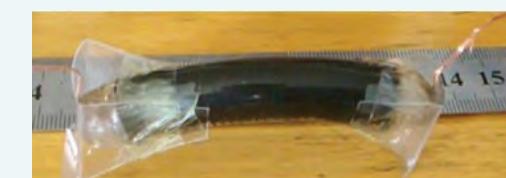

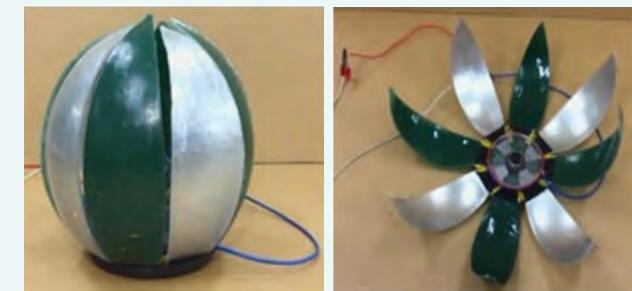

Session Chair:
Yoseph Bar-Cohen
Jet Propulsion Lab. (USA)

This Session highlights some of the latest capabilities and applications of Electroactive Polymers (EAP) materials where the attendees are shown demonstrations of these materials in action. Also, the attendees interact directly with technology developers and given "hands-on" experience with this emerging technology. The first Human/EAP-Robot Armwrestling Contest was held during this session of the 2005 EAPAD conference.

Applications of smart polymers

Liwu Liu, Jinrong Li, Fengfeng Li, Xiongfei Lv, Jinsong Leng,
Harbin Institute of Technology (China)

This demonstration will show smart polymer in action taking advantages of their being light weight, fast response, and large deformation. This advantages makes them attractive for applications in smart bionics, aerospace, biomedicine and other fields. The demonstration will include application of shape memory polymer (SMP) and dielectric elastomer EAP as actuators and deployable structures.

Tentative EAP Demonstrations

Devices from actuating fishing line

Jeffrey Chan, Cameron Frayne, Brian Uifalusi, Justin Wyss, Joe Fang, Liam Henderson, Daniel Louie, Michael Uifalusi, Joshua Conde Ng, Tobias Kreykenbohm, Samuel Ng, Zetong Zhang, Soheil Kianzad, Yuta Dobashi, Ali Rafiee, John D.W. Madden, Univ. of British Columbia (Canada)

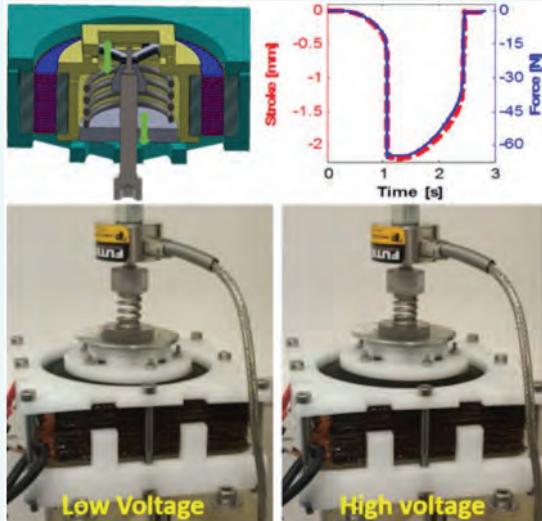

Student teams from the University of British Columbia are developing devices that take advantage of the high stress and strain of coiled nylon-based thermal actuators. These devices are current driven, with the Joule heating enabling reversible contraction of the helically wound nylon fibers. Devices under development by the student teams include a flapping fish fin, a latch mechanism, and a wearable biomedical device. Projects are still underway, and so attendance at the conference will be on the condition that performance targets are met.

18TH ANNUAL EAP-IN-ACTION SESSION AND DEMONSTRATIONS

High force dielectric electroactive polymer (DEAP) membrane actuator

Steffen Hau, Alexander York, Saarland Univ. (Germany)

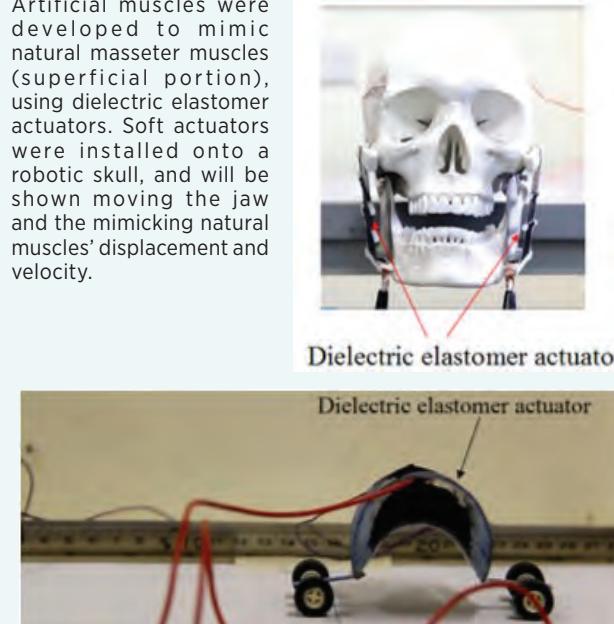

Energy efficiency, lightweight and scalability are key features for actuators in applications such as valves, pumps or any portable system. DEAP technology is able to fulfill these requirements better than commonly used technology e.g. solenoid, but has limitations concerning force and stroke. This demo will show the improvements that were made in increasing the force that is delivered by DEAP stack. Two different actuators are will be shown: The first is able to lift 10kg. The second can generate a force of 66N while acting against a spring load.

Soft robots based on dielectric elastomer actuators

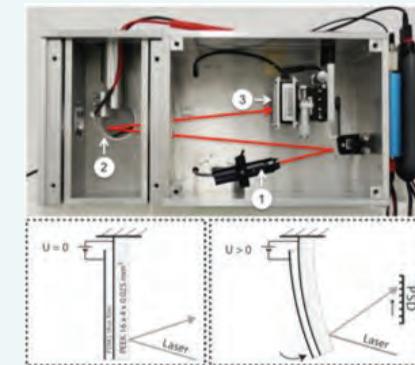

Jian Zhu, Yuzhe Wang, Ujjaval Gupta, National Univ. of Singapore (Singapore)

Artificial muscles were developed to mimic natural masseter muscles (superficial portion), using dielectric elastomer actuators. Soft actuators were installed onto a robotic skull, and will be shown moving the jaw and the mimicking natural muscles' displacement and velocity.

Apparatus for measuring the actuation forces of DEAs via cantilever bending

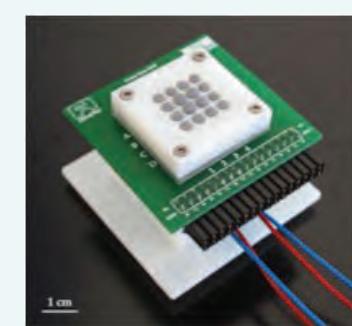

Bekim Osmani, Tino Töpper, Vanessa Leung, and Bert Müller, Univ. of Basel (Switzerland)

A compact, simple-to-operate apparatus for measuring the generated forces of planar dielectric elastomer actuators (DEA) will be demonstrated. DEA structures are fabricated on top of a cantilever substrate material with well-known mechanical properties such as PEN, PEEK, or Kapton film. When a DC-voltage is applied to the planar electrodes on either side of the elastomer layer, the resulting deformation of the incompressible elastomer bends the cantilever. The bending curvature is measured by the deflection of a laser beam reflected from the cantilever onto a position sensitive detector. This cantilever system can be used to evaluate the maximal strains of single- as well as multilayer DEAs.

Tactile display based on shape memory polymers

Nadine Besse, Samuel Rosset, Alexandre Poulin, Herbert Shea, Ecole Polytechnique Fédérale de Lausanne (EPFL) (Switzerland)

A fully latching and scalable 4x4 tactile display will be demonstrated to have 300 mN holding force and 300 µm motion per taxel (tactile pixel). The device, which is intended to provide graphical information to visually impaired users, consists of a shape memory polymer membrane, a compliant integrated heater per taxel, and a single common pneumatic actuation mechanism. Each taxel is individually addressable and the entire display can be refreshed in 5 seconds.

18TH ANNUAL EAP-IN-ACTION SESSION AND DEMONSTRATIONS

Synthetic Muscle™: shape-morphing EAP based materials and actuators

Lenore Rasmussen, Eric Sandberg, Leila Albers, Simone Rodriguez, Ras Labs (USA)

Ras Labs electroactive polymer (EAP) based materials and actuators contract, and with reversed electric input polarity, expand. A thin shape-morphing film of the material in the expansion mode produces raised surface zones in desired shapes. A thick shape-morphing pad can controllably contract or expand, which are being used to prototype self-adjusting extremely comfortable prosthetic socket liners and other void-filling continual-fit applications. These EAPs can easily serve dual use as sensors, which can be tied in to automatic adjustment and biofeedback, and can communicate the number of impacts and severity of impact/pressure. Actuation can be performed underwater or on land with suitable elastomeric coatings. These robust EAPs (extreme temperature, high and low pressures) are being tested for radiation resistance on the International Space Center (ISS) National Laboratory. A protective cage with Ras Labs Synthetic Muscle™ EAP samples, similar to the hardware of the ISS experiment, will be also be presented.

New technology from the Biomimetics Laboratory and StretchSense Ltd.

Iain Anderson, Markus Henke, Patrin Illenberger, Andreas Tairych, Allan Veale, Chris Walker, StretchSense Ltd. (New Zealand)

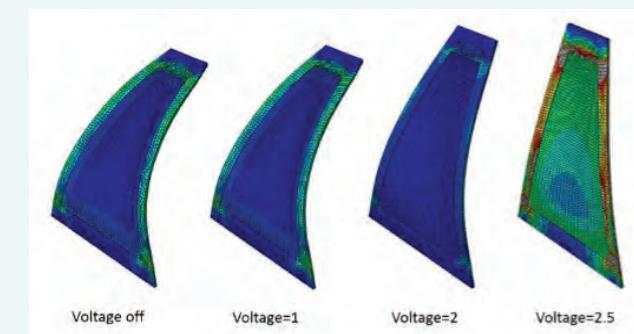

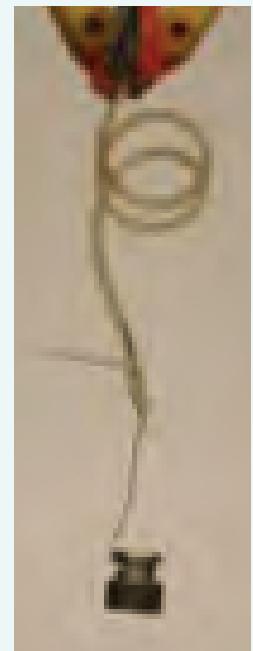

The Biomimetics Lab and our spinout company StretchSense Ltd. will demonstrate EAP advances that will lead to an exciting future of autonomous robots, wearable sensors, and energy harvesters!

- (3) Giving wearable muscles cyber-proprioception. With soft wearable motion sensing we can augment our strength and get machines to follow our gesture based commands.
- (4) Self-powered wearable sensing. Stretchsense is developing sensors powered by human movement. This will enable wearable sensing that you can wear and forget.

Shape memory programmable and electrically controllable IPMC

Qi Shen, Sarah Trabia, Tyler Stalbaum, Choonhan Lee, Robert Hunt, and Kwang Kim, Univ. of Nevada, Las Vegas (USA)

Recently, the UNLV team successfully demonstrated an ionic polymer-metal composite (IPMC) actuator, having multiple-shape memory by two external inputs, electrical and thermal. This demonstration introduces a soft multiple-shape-memory IPMC actuator having multiple degrees-of-freedoms that exhibited high maneuverability when controlled by two external inputs, allowing complex motions that are routine in nature.

Soft robotics and smart SAM structures

Tiefeng Li, Yuhan Xie, Guorui Li, Yiming Liang, Xuxu Yang, Yongbing Jin, Zhejiang Univ. (China)

In this demonstration, soft robotics and smart structures driven by dielectric elastomer will be shown in large actuation task, fast response and actuating-sensing integrated abilities. The materials are made of temperature active tough hydrogel and the objective is to use them for bio-medical applications.

Also, the attendees interact directly with technology developers and given "hands-on" experience with this emerging technology. The first Human/EAP Robot Armwrestling Contest was held during this session of the 2005 EAPAD conference.

See the full program and descriptions of EAP presentations on pages 13-15.

Acceptance of Policies and Registration Conditions

The following Policies and Conditions apply to all SPIE Events. As a condition of registration, you will be required to acknowledge and accept the SPIE Registration Policies and Conditions contained herein.

Granting Attendee Registration and Admission

SPIE, or their officially designated event management, in their sole discretion, reserves the right to accept or decline an individual's registration for an event. Further, SPIE, or event management, reserves the right to prohibit entry or remove any individual whether registered or not, be they attendees, exhibitors, representatives, or vendors, who in their sole opinion are not, or whose conduct is not, in keeping with the character and purpose of the event. Without limiting the foregoing, SPIE and event management reserve the right to remove or refuse entry to any attendee, exhibitor, representative, or vendor who has registered or gained access under false pretenses, provided false information, or for any other reason whatsoever that they deem is cause under the circumstances.

SPIE Safe Meeting and Misconduct Policy

SPIE is a professional, not-for-profit society committed to providing valuable and safe conference and exhibition experiences. SPIE is dedicated to equal opportunity and treatment for all its members, meeting attendees, staff, and contractors. Attendees are expected to be respectful to other attendees, SPIE staff, and contractors. Harassment and other misconduct will not be tolerated; violators will be addressed promptly and seriously. Consequences up to and including expulsion from the event as appropriate will be implemented immediately.

The SPIE anti-harassment policy can be found at <http://spie.org/policy>.

Reporting of Unethical or Inappropriate Behavior

SPIE is an organization with strong values of responsibility and integrity. Our Harassment Policy, Ethics Statement, and Code of Professional Conduct contain general guidelines for behavior and for conducting business with the highest standards of ethics.

Onsite at a SPIE meeting, contact any SPIE Staff member with concerns or questions for thorough follow-up. If you feel in immediate danger, please dial 911 for police intervention.

SPIE has established a confidential reporting system for staff and all meetings participants to raise concerns about possible unethical or inappropriate behavior within our community. Complaints may be filed by phone at +1-888-818-6898 or at www.SPIE.ethicpoint.com and, if preferred, may be made anonymously.

Identification

To verify registered participants and provide a measure of security, SPIE will ask attendees to present a government-issued Photo ID at registration to collect registration materials.

Individuals are not allowed to pick up badges for attendees other than themselves. Further, attendees may not have some other person participate in their place at any conference-related activity. Such other individuals will be required to register on their own behalf to participate.

Capture and Use of a Person's Image

By registering for an SPIE event, I grant full permission to SPIE to capture, store, use, and/or reproduce my image or likeness by any audio and/or visual recording technique (including electronic/digital photographs or videos), and create derivative works of these images and recordings in any SPIE media now known or later developed, for any legitimate SPIE marketing or promotional purpose.

By registering for an SPIE event, I waive any right to inspect or approve the use of the images or recordings or of any written copy. I also waive any right to royalties or other compensation arising from or related to the use of the images, recordings, or materials. By registering, I release, defend, indemnify and hold harmless SPIE from and against any claims, damages or liability arising from or related to the use of the images, recordings or materials, including but not limited to claims of defamation, invasion of privacy, or rights of publicity or copyright infringement, or any misuse, distortion, blurring, alteration, optical illusion or use in composite form that may occur or be produced in taking, processing, reduction or production of the finished product, its publication or distribution.

Payment Method

Registrants for paid elements of the event, who do not provide a method of payment, will not be able to complete their registration. Individuals with incomplete registrations will not be able to attend the conference until payment has been made. SPIE accepts VISA, MasterCard, American Express, Discover, Diner's Club, checks and wire transfers. Onsite registrations can also pay with Cash.

Authors/Coauthors

By submitting an abstract, you agree to the following conditions:

- An author or coauthor (including keynote, invited, and solicited speakers) will register at the author registration rate, attend the meeting, and make the presentation as scheduled.
- A manuscript (minimum 6 pages, maximum 20 pages) for any accepted oral, invited, keynote, or poster presentation will be submitted for publication in the *Proceedings of SPIE* in the SPIE Digital Library. Some SPIE events have other requirements that the author is made aware of at the time of submission.
- Only papers presented at the conference and received according to publication guidelines and timelines will be published in the *Proceedings of SPIE* in the SPIE Digital Library (or via the requirements of that event).

Audio, Video, Digital Recording Policy

Conferences, courses, and poster sessions: For copyright reasons, recordings of any kind are prohibited without prior written consent of the presenter or instructor. Attendees may not capture or use the materials presented in any meeting/course room or in course notes on display without written permission.

Consent forms are available at Speaker Check-In. Individuals not complying with this policy will be asked to leave a given session and/or asked to surrender their recording media.

EXHIBITION HALL: For security and courtesy reasons, recordings of any kind are prohibited unless one has explicit permission from on-site company representatives. Individuals not complying with this policy will be asked to surrender their recording media and to leave the exhibition hall.

Your registration signifies your agreement to be photographed or videotaped by SPIE in the course of normal business. Such photos and video may be used in SPIE marketing materials or other SPIE promotional items.

Laser Pointer Safety Information/Policy

SPIE supplies tested and safety-approved laser pointers for all conference meeting rooms. For safety reasons, SPIE requests that presenters use provided laser pointers.

Use of a personal laser pointer represents user's acceptance of liability for use of a non-SPIE-supplied laser pointer. If you choose to use your own laser pointer, it must be tested to ensure <5 mW power output. Laser pointers in Class II and IIIa (<5mW) are eye safe if power output is correct, but output must be verified because manufacturer labeling may not match actual output. Come to Speaker Check-In and test your laser pointer on our power meter. You are required to sign a waiver releasing SPIE of any liability for use of potentially non-safe, personal laser pointers. Misuse of any laser pointer can lead to eye damage.

Access to Technical and Networking Events

Persons under the age of 18 including babies, carried or in strollers, and toddlers are not allowed in technical or networking events. Anyone 18 or older must register as an attendee. All technical and networking events require a valid conference badge for admission.

Unauthorized Solicitation Policy

Unauthorized solicitation is prohibited. Any non-exhibiting manufacturer or supplier observed to be distributing information or soliciting business in the aisles, or in another company's booth, will be asked to leave immediately.

Unsecured Items Policy

Personal belongings should not be left unattended in meeting rooms or public areas. Unattended items are subject to removal by security. SPIE is not responsible for items left unattended.

Wireless Internet Service Policy

At SPIE events where wireless is included with your registration, SPIE provides wireless access for attendees during the conference and exhibition but cannot guarantee full coverage in all locations, all of the time. Please be respectful of your time and usage so that all attendees are able to access the internet.

Excessive usage (e.g., streaming video, gaming, multiple devices) reduces bandwidth and increases cost for all attendees. No routers may be attached to the network. Properly secure your computer before accessing the public wireless network. Failure to do so may allow unauthorized access to your laptop as well as potentially introduce viruses to your computer and/or presentation. SPIE is not responsible for computer viruses or other computer damage.

Mobile Phones and Related Devices Policy

Mobile phones, tablets, laptops, pagers, and any similar electronic devices should be silenced during conference sessions. Please exit the conference room before answering or beginning a phone conversation.

Smoking

For the health and consideration of all attendees, smoking, including e-cigarettes, is not permitted at any event elements, such as but not limited to: plenaries, conferences, workshops, courses, poster sessions, hosted meal functions, receptions, and in the exhibit hall. Most facilities also prohibit smoking and e-cigarettes in all or specific areas. Attendees should obey any signs preventing or authorizing smoking in specified locations.

Hold Harmless

Attendee agrees to release and hold harmless SPIE from any and all claims, demands, and causes of action arising out of or relating to your participation in the event you are registering to participate in and use of any associated facilities or hotels.

Event Cancellation

If for some unforeseen reason SPIE should have to cancel the event, registration fees processed will be refunded to registrants. Registrants will be responsible for cancellation of travel arrangements or housing reservations and the applicable fees.
