Welcome

Photonics Europe has moved to the heart of Europe and to a brand new conference centre in the very city centre of Brussels.

Photonics Europe is the place to be. It brings together different disciplines, technologies, and perspectives from across Europe and around the world. As a participant, you will be among the leaders who are presenting research, developing new contacts, and learning about the latest funding opportunities.

- Photonics Europe is conferences, workshops, seminars, and an exhibition that will combine into a dynamic learning environment
- Photonics Europe serves as the platform for new information updates on the European Commission's 7th Research Framework Programme (FP7)
- Photonics Europe features comprehensive "hot topics" sessions, and will include a unique welcoming reception, daily coffee breaks, plus other technical and social events
- Photonics Europe presents the Innovation Village: a window on creative products developed by universities and research centres
- Photonics Europe hosts the European Village: a display on European initiatives, Networks of Excellence, Integrated Projects and other EC-projects that showcase their consortium as well as their newest breakthroughs

Brussels' historical city centre provides a great atmosphere, against a backdrop of excellent dining, comfortable facilities, straightforward accessibility and easy transportation. The leadership of Photonics Europe 2010 has selected many of the toughest issues facing optical and photonics technologies today as the basis for their programmes. These current research issues will drive the development of new products for years to come.

Prof Ursula Keller, ETH Zurich, Switzerland

The MIXSEL: a novel ultrafast semiconductor laser with multi-Watt average output power

Thin disk lasers are based on a power-scalable concept and are ideally suited for passive modelocking with a semiconductor saturable absorber mirror (SESAM). Semiconductor thin disk lasers (also referred to as vertical external cavity surface emitting laser (VECSEL) or optically pumped semiconductor lasers (OPS)) allow for a higher level of integration which further reduces fabrication costs of compact ultrafast lasers in the future: the SESAM and the VECSEL gain structure can be integrated into a single semiconductor wafer structure, which is referred to as a modelocked integrated external-cavity surface emitting laser (MIXSEL). Most recently, an optically pumped MIXSEL generated picosecond pulses at gigahertz pulse repetition rates with an average power of more than 5 W. We believe that these MIXSELS can offer a solution for many applications where the current laser technology is considered to be too bulky or expensive.

Ursula Keller joined ETH as a tenured professor of physics in 1993. She received the Ph.D. in Applied Physics from Stanford University in 1989 and the Physics "Diplom" from ETH in 1984. She was a Member of Technical Staff (MTS) at AT&T Bell Laboratories in New Jersey from 1989 to 1993. Her research interests are exploring and pushing the frontiers in ultrafast science and technology: ultrafast solid-state and semiconductor lasers, ultrashort pulse generation in the one to two optical cycle regime, frequency

ACCORD is an experimental program under the Sixth Framework Programme of the European Union (IST-2005-2.5.1, Photonic Components), that aims to create new opportunities for both photonics companies and photonics students.

The project aims to:

- Purchase at marginal cost pre-competitive photonic devices from innovative European companies and put them in the hands of European researchers and students, at no net cost to the university or to the company that furnished the devices and
- Facilitate transfer of device evaluation results to potential end-users, assisting companies to access new markets and new applications.

The ACCORD-project will officially close at Photonics Europe 2010 with a workshop highlighting the results of the project, testimonials and prospects towards the future.

ACCORD funded 12 projects between Industry and Universities under a European FP6 Support Action. The programme's success has been recognised by the award of a FP7 Support Action starting in July 2010 with the target of awarding at least 12 more projects.

Giorgio Anania currently serves as Chairman of Cube Optics and Vice President of Photonics²¹. Before, Giorgio held the position of CEO of Bookham (now Oclaro) since February 2001; a company which he helped take public on NASDAQ in 2000 and where revenues grew from zero to \$220 million per year in the period, through acquisitions and internal development. Prior to CEO, Giorgio served as Senior Vice President Sales and Marketing since joining Bookham in 1998. Previously Giorgio was Vice President for Sales, Marketing and Business Development at Flamel Technologies (NASDAQ: FLML), a French medical equipment company, which he helped take public in 1996. Nanoscopy with focused light

Stefan Hell, Max Planck Institute for Biophysical Chemistry, Germany

For more than a century, it has been generally accepted that the resolution of a lens-based optical microscope is limited to about $d = \lambda/(2NA) > 200$ nm in the focal plane and > 500 nm along the optic axis, with NA denoting the numerical aperture of the lens and the wavelength of light. The discovery in the 1990's that elementary transitions between the states of a fluorophore can be used to eliminate the limiting role of diffraction has led to light microscopy concepts with resolution on the nanometer scale^{1, 2}. Currently, all existing and successfully applied nanoscopy methods share a common enabling element: they switch fluorescence on

or off, so that adjacent features are registered sequentially in time^{3, 4}.

For example, in a typical Stimulated Emission Depletion (STED) microscope⁵, the fluorophores are switched off (=kept dark) by overlapping the excitation beam with a de-exciting (STED) beam which effectively confines the fluorophores to the ground state everywhere in the focal region except at a tiny area where the STED beam is close to zero. Fluorophores that are located in this subdiffraction-sized smaller area are registered. Scanning the beams further in space registers those fluorophores that had been switched off. An image of the whole object is assembled by sequential registration. The resolution is now given by the smaller diameter $d \approx \lambda/(2NA\sqrt{1+I_s/I_e})$ of this area in which the fluorophores are still fluorescent. I_s is the intensity of the STED beam, which, for $I_s \gg I_e$, entails $d \rightarrow 0$, meaning that the resolution is conceptually no longer limited by λ .

STED microscopy has been used to investigate the fate of synaptic vesicle proteins after exocytosis⁶, thus demonstrating the potential of emerging 'fluorescence nanoscopy' for the life sciences. A video-rate STED microscope was used to describe the mobility of vesicles inside the axons of cultured living neurons⁶. Live-cell STED microscopy has also been used to image activity-dependent morphological plasticity of dendritic spines⁷, while in another study, it revealed that single sphingolipids, but not phospholipids, are transiently (< 10 ms) and locally (< 20 nm) trapped in a living cell membrane, mediated by cholesterol⁸.

The concept of STED microscopy has been expanded to low intensity operation by switching the fluorophore to a long-lived dark (triplet) state or between a 'fluorescence activated' and a 'deactivated' (conformational) state⁹ as encountered in switchable fluorescent proteins⁹. More recent but seminal nanoscopy schemes such as PALM, STORM and also GSDIM, switch the molecules individually and stochastically to a state that emits $m \gg 1$ detectable photons in a row before returning to a dark state, allowing the calculation of their position. These single fluorophore switching concepts¹⁰⁻¹⁴ require only a single switching cycle^{3, 4} per fluorophore, which greatly extends the power of the switching concept for subdiffraction separation. Altogether, lens-based optical nanoscopy is an unexpected and fascinating development in the physical sciences that is poised to impact several areas of science, in particular the life sciences, in the near future.

The Light Touch: Advanced Micromanipulation and Photoporation

Kishan Dholakia, St. Andrews Univ., United Kingdom

Light is incredible. In the realm of interdisciplinary science and particularly biophotonics, it has enabled some astounding advances since the advent of the laser fifty years ago. The momentum of light may be used to hold and move colloidal particles and cells. Such optical micromanipulation has changed the way we understand single molecule biophysics, cell mechanics, the angular momentum of light amongst other key topics. Photonics can also be used for controlled nanosurgery at the cellular and sub-cellular level, in particular allowing the delivery of therapeutic agents at will to cells of choice - photoporation. Underpinning these areas we have

seen a proliferation in methods to optically sculpt the light field to create exotic and unusual beam profiles that have led to major advances in these fields. I will give an overview of the field of micromanipulation and photoporation emphasizing the use of advanced photonics and beam sculpting for applications. These fields seem set to play a key role in shaping the future of biophotonics.

Kishan Dholakia is Professor of Physics at the University of St. Andrews Scotland and an honorary adjunct Professor at the centre for Optical Sciences at the University of Arizona, USA. He heads the Optical Trapping Group which works on various aspects of photonics including advanced light fields, micromanipulation and biophotonics. He has published over 300 journal/conference papers and his group won the European Optics Prize in 2003. He has commercialized a variety of optical trapping apparatus through liaison with industry and his portable optical Tweezers developed with Elliot Scientific won the Photonics Circle of Excellence award in 2005. He holds a large number of grants and is a core partner in the EU Network of Excellence for Biophotonics "Photonics 4 Life". He was elected to the position of Fellow of the Royal Society of Edinburgh in 2007. In 2008 he was elected to position of Fellow of the Optical Society of America and received a Royal Society Wolfson Merit Award. In 2009 he was made a Fellow of SPIE.

Bridging Photonics and Computing

Mario Paniccia, Intel Corporation, United States

The silicon chip has been the mainstay of the electronics industry for the last 40 years and has revolutionized the way the world operates. Today a silicon chip the size of a fingernail contains over one billion transistors and has the computing power that only a decade ago would take up an entire room of servers. Silicon photonics that mainly based upon silicon on insulator (SOI) has recently attracted a great deal of attention since it offers an opportunity for low cost opto-electronic solutions for applications ranging from telecommunications down to chip-to-chip interconnects as well as possible applications in new emerging areas such as optical sensing and or bio-medical applications.

Recent advances and research breakthroughs in silicon photonic device performance over last few years have shown that silicon can be considered as a material onto which one can build future optical devices. While significant efforts are needed to improve device performance and to “commercialize” these technologies, progress is moving at a rapid rate. If successful, silicon photonics may similarly come to dominate the optical communications as it has the electronics industry. This keynote will provide overview of silicon photonics research at Intel Corporation, describe some of the recent advances in device performance and discuss the key building blocks needed for “siliconizing” photonics. In addition the presentation will provide an overview and discussion on potential applications and future opportunities for enabling “photonics” in and around the PC and platform .

Dr. Mario Paniccia is an Intel Fellow and Director of the Photonic Technology Lab at Intel Corporation. Mario currently directs a research group focused in the area of Silicon Photonics. The team is developing silicon-based photonic building blocks for future use in enterprise and data center communications. Mario has worked in many areas of optical technologies during his career at Intel including optical testing for leading edge microprocessors, optical communications and optical interconnects. His teams pioneering activities in silicon photonics have led to many firsts such as the first silicon modulator with bandwidth >1GHz (2004) and then the first at 40Gb/s (2007). The first continuous wave Silicon laser breakthrough (2005) and together with UCSB, the world’s first “Hybrid Silicon Laser” (2006). Mario has won numerous awards including in November 2004 Mario was awarded by Scientific American to be one of the top 50 researchers for his teams work in the area of silicon photonics. In October 2008 Dr Paniccia was being by R&D Magazine as “Scientist of the year” for his teams pioneering research in the area of Silicon Photonics. He has published numerous papers, including 3 Nature papers, 3 book chapters, and has over 65 patents issued or pending. He is a senior member of IEEE and a fellow of OSA. Mario earned a B.S. degree in Physics in 1988 from the State University of New York at Binghamton and a Ph.D. degree in Solid State Physics from Purdue University in 1994.

InP Photonic Integration: Past, Present and Future

Radhakrishnan Nagarajan, Infinera Corporation, United States

Photonic integration has an active research history dating back to the late 1960’s. This area of development that started with the integration of a handful of devices saw the first commercial deployment of Large Scale Photonic Integrated Circuits (LS-PIC), with over 50 discrete components monolithically integrated onto to single InP substrate, only five years ago. Experimentally to date, monolithically integrated devices on InP with well over 200 components have demonstrated. We will review the progress, current state of the art, and possible future directions in this field.

Radhakrishnan Nagarajan is with Infinera where he works on various aspects of large scale photonic integration on the InP platform. He obtained his B.Eng. degree in Electrical Engineering from the National University of Singapore, his M.Eng. from the University of Tokyo, and his Ph.D. from the University of California, Santa Barbara. He was with SDL from 1995 to 2001 when it was acquired by JDS Uniphase. He joined Infinera in 2001, where he is currently a Senior Director, Optical Components Technology. At SDL, among other things, he managed the development of the new generation 980nm EDFA pump module which won the Photonics Circle of Excellence Award in 2000. He has authored/co-authored over 150 publications in journals and conferences. He has also authored three book chapters in the area of high speed optical components. He has been awarded 38 US patents.

He is a Fellow of the Institute of Electrical and Electronics Engineers (IEEE), the Optical Society of America (OSA) and the Institution of Engineering and Technology (IET). In 2006 he shared the IEEE/LEOS Aron Kressel Award for his work on commercializing large scale photonic integrated circuits which have found widespread deployment in commercial optical transport networks.

Lasers in the 21st Century: A Scientific Community Going Global

Wolfgang Sandner, Max Born Institute Berlin, FR Germany

Lasers have changed the world in most areas of science, technology and life sciences, and have become an eminent economic factor world-wide. The underlying principle, controlling the coherence of light, has proven unbrokenly successful, even if numerous technological incarnations and generations of laser devices have come and gone over the last 50 years. Today, lasers span the range from sub-millimetre sized semiconductor devices to factory-size fusion facilities, and ever new laser technologies and architectures are being invented.

The scientific laser community is the driving force of most of these developments. With the size of some laser facilities and the scientific and economic challenges growing larger and larger the community is on its way to develop enhanced national, international and global cooperation. During the last decades the European Community with its activities on Transnational Access, Joint Research Activities and networking between laser research infrastructures has set new standards which formed a community strong enough to tackle the world's first truly international laser projects, aiming at highest intensities and laser fusion energy, respectively. Simultaneously, the unparalleled progress in laser power and intensity opened the way for new science and interdisciplinary cooperations, such as laboratory astrophysics, nonlinear QED, particle acceleration, lasers in nuclear physics and medical applications, to name only a few. These scientific areas are typically pursued on a global scale and are expected to grow considerably in the near future. The talk will provide examples for the most recent international trends in laser development and scientific cooperations.

Prof. Dr. Wolfgang Sandner received a PhD in atomic physics from the University Freiburg (Germany) in 1979, followed by a postdoctoral appointment at SRI International (Stanford Research Institute) in Menlo Park, USA. Between 1985 and 1994 he held professorships in Würzburg (Germany), Freiburg and at the University of Tennessee, USA. In 1993 he was appointed director at the Max Born Institute in Berlin Adlershof, and 1994 also Professor at the Technische Universität Berlin. W. Sandner is member of a number of national and international committees in science and science policy, particularly in the European Union, as counsellor for the Federal Research Ministry BMBF, and as evaluator for national and international research organisations. Since 2003 he leads as coordinator the European network LASERLAB-EUROPE of meanwhile 26 of the most important laser research infrastructures from 16 European countries. He is President Elect of the German Physical Society DPG for the period 2010 to 2012.

Professor Sandner's present research focuses on laser interaction with matter, particularly the investigation of systems in strong and ultra-strong laser fields. Research topics include relativistic plasma dynamics, laser particle acceleration, ionisation dynamics in strong laser fields, table-top X-ray lasers and short-pulse laser development at highest peak and average power.

17.30 to 18.00

From Picosecond to Attosecond Pulse Generation

Ursula Keller, ETH Zurich, Switzerland

Watching ultrafast processes in real time has been the driving force to generate shorter and shorter laser pulses. Picosecond pulses were generated soon after the first laser was demonstrated in 1960. Stable picosecond pulse generation was obtained later with active modelocking, and first femtosecond pulses with passively modelocked dye lasers. These dye lasers were the "work horse" for most of the femtosecond pump-probe measurements in physics and chemistry in the 70's and early 80's, ultimately resulting in a Nobel Prize in "femtochemistry". Ultrafast solid-state lasers supplanted dye lasers with the discovery of the Ti:sapphire laser, Kerr lens modelocking (KLM) and the semiconductor saturable absorber mirror (SESAM). Today we have pushed the frontiers in generation of infrared pulses to pulsewidths as short as one to two optical cycles, with pulse energies of 10 to 100 μ J directly from a laser oscillator without further amplification, and with pulse repetition rates of more than 100 GHz. Ultrafast solid-state lasers are now being introduced into industrial mass production, and many more applications have been established which go far beyond simple time-resolved measurements. Furthermore, the electric field underneath the pulse envelope can be stabilized and controlled, and amplified solid-state laser systems now can generate single attosecond pulses with close to 100 attosecond pulse duration. The fastest measurement that has ever been made directly in the time domain has been enabled by the exact timing of a two-cycle circularly-polarized laser pulse field vector (similar to the hand of a clock) and sets an upper limit in the tunneling delay time of 12 attoseconds.

Ursula Keller joined ETH as a tenured professor of physics in 1993. She received the Ph.D. in Applied Physics from Stanford University in 1989 and the Physics "Diplom" from ETH in 1984. She was a Member of Technical Staff (MTS) at AT&T Bell Laboratories in New Jersey from 1989 to 1993. Her research interests are exploring and pushing the frontiers in ultrafast science and technology: ultrafast solid-state and semiconductor lasers, ultrashort pulse generation in the one to two optical cycle regime, frequency comb generation and stabilization, reliable and functional instrumentation for extreme ultraviolet (EUV) to X-ray generation, attosecond experiments using high harmonic generation, and attosecond science.

She has published more than 290 peer-reviewed journal papers and 11 book chapters and she holds or applied for 17 patents. She was a "Visiting Miller Professor" at UC Berkeley in 2006 and a visiting professor at the Lund Institute of Technologies in 2001. She received the OSA Fraunhofer/Burley Prize in 2008, the Philip Morris Research Award in 2005, the first-placed award of the Berthold Leibinger Innovation Prize in 2004, and the Carl Zeiss Research Award in 1998. She was the "2006 Ångström lecturer" supported by the Royal Swedish Academy of Sciences and the LEOS Distinguished Lecturer for modelocked solid-state lasers in 2000. The Thomson Citation Index highlighted her as the third-place top-cited researcher during a decade (1991-1999) in the field of optoelectronics in 2000. She is an OSA Fellow and an elected foreign member of the Royal Swedish Academy of Sciences and the German Academy Leopoldina.

Development of the World's Highest Power Lasers: a European Success Story

Mike Dunne, Science & Technology Facilities Council, United Kingdom

Lasers with powers of over 1 Petawatt (10^{15} Watts) are now routinely operated around the world. This represents a power roughly 100 times greater than the entire electricity generating capacity of the world - delivered in a millionth of a millionth of a second. Understandably, these lasers are able to generate truly extreme conditions of temperature and pressure. This allows laboratory studies of the physics that drives violent astrophysical processes, as well as the generation of high energy beams of particles that can be harnessed for medical, security and fundamental science applications. They also provide new routes to realising the dream of harnessing fusion energy as a game-changing source of secure, safe, environmentally sustainable electricity for our civilization. Scientific proof of this dream may even be demonstrated in this golden anniversary year. Europe is a leader in this field - with a long history of academic and industrial success, and national facilities offering open access for the exploitation of these extreme sources of light. This leadership is set to continue over the coming decade with new, pan-European projects to take the field to new heights. The Extreme Light Infrastructure (ELI) project is being designed to deliver in excess of 100 Petawatts, along with broad-based applications of ultra-intense and ultra-short laser systems. Hosted by the Czech Republic, Hungary and Romania, this facility is set to appear in the middle of the coming decade. Complementing this, the HiPER project is being designed to demonstrate the route to fusion energy production using lasers.

Taken together with the existing suite of pre-eminent laser facilities, we are at a golden age of laser development and exploitation - seeing rapid enhancement of capability into ever higher powers and ever shorter pulses, and the emergence of a very wide range of applications that impact some of the most profound challenges facing our society.

This talk will provide a brief glimpse into this exciting and rapidly evolving world, charting recent progress and providing examples of the research being performed on these laser systems.

Professor Mike Dunne is Director of STFC's Photon Science Department, with staff and facilities at both the Rutherford Appleton and Daresbury Laboratories. He is responsible for the leadership of a coherent science strategy for the exploitation of all types of photon sources - including lasers, synchrotrons and Free Electron Light sources.

As part of this role he is Director of the UK's Central Laser Facility, which is home to the world's most intense laser facilities, with science programmes ranging from fusion energy to biomedical research and the pursuit of a new generation of miniaturized particle accelerators. These capabilities are in great demand by scientists from across the world, and support a vibrant UK academic community.

Mike is the international leader of a project to deliver a European laser fusion facility called HiPER. HiPER is one of the few € Billion scale facility opportunities recently accepted onto the European Roadmap of future Research Infrastructures, as well as onto the UK Large Facilities Roadmap. HiPER's purpose is to establish a clear path towards a commercially viable laser fusion power plant, building from the upcoming demonstration of energy gain by the USA. It will enable a wide range of new fundamental science studies in truly extreme conditions not otherwise achievable on Earth.

He represents the UK on a number of European and International bodies associated with his technical area of expertise - including bodies within IAEA, Euratom, IUPAP and the EPS. He has received a number of awards and is the author of over 60 technical papers.

Visualizing Light Fields in Nanophotonics

L. (Kobus) Kuipers, Univ. of Amsterdam, Netherlands

Nanostructures such as photonic crystals and plasmonic metalodielectrics can exert a huge control over light at the nanoscale. This control is of both academic and industrial interest. Nanoconfinement of light can miniaturize optical chips and the slow light achievable with photonic crystals leads to increased light-matter interactions with a potential for new (bio)sensors and ultrafast all-optical switches. Implicit in the control of light at the nanoscale is that the light field itself no longer conforms to our everyday intuition in terms

of plane waves or rays. Close to a nanophotonic structure the light field itself becomes highly structured.

In order to investigate light fields at the nanoscale in detail a subwavelength resolution is crucial. We have succeeded in measuring the structure of light in the near field of photonic crystal waveguides with phase-sensitive near-field microscopy. It turns out that the evanescent field of these waveguides is much richer than expected due to the Bloch nature of the eigenmodes. For example, it turns out that the light does not decay with a single or even multiple exponents away from the surface as might have naively been expected [1]. With a breakthrough in near-field microscopy we have succeeded to separate the two electric field components in to the plane above the waveguide structure and the phase difference between them. As a consequence we can reconstruct the polarization ellipse for every point above the nanophotonic structure. We find that the polarization above a photonics crystal structure is highly dependent on position to extent that the field even contains so-called polarization singularities [2]. The breakthrough has enabled the visualization of the effective excitation of nanowire plasmon modes through adiabatic mode transformation [3]. Building on our ability to distinguish different vector components, we used a 'split' nanoprobe to visualize the magnetic component of propagating light at optical frequencies [4]. This integral part of light is never observed as light-matter interactions are usually governed by the electric part rather than the magnetic part.

Plastic Photonics and Electronics: a Myth or Reality?

Bernard Kippelen, Georgia Institute of Technology, United States

Organic synthetic molecules and polymers have invaded our daily lives because of their renowned optical and mechanical properties, their light weight and their ability to be mass produced at low cost using various extrusion, coating, and printing techniques. Advances during the last 30 years in the synthesis and processing of organic materials with nonlinear optical and semiconducting properties, have fueled the emergence of a new technology that can potentially lead to low cost, flexible, and large area plastic optoelectronic chips.

Recent research breakthroughs in electro-optic modulators, light-emitting diodes for displays and lighting, solar cells, and thin-film transistors are bringing flexible photonic and electronic technologies closer to commercialization.

In this plenary talk, we will review recent advances in organic molecules and polymers for organic optoelectronics. We will discuss the origin of nonlinear optical properties, charge transport, and light emission in conjugated organic materials with an emphasis on how structure at the nanoscale relates to various physical properties. Finally, we will review the latest developments in examples of applications, including organic modulators, electroluminescent devices for lighting, photovoltaic cells for power generation, and printed electronics.

Bernard Kippelen is currently a professor at the School of Electrical and Computer Engineering at the Georgia Institute of Technology, located in Atlanta, Georgia, USA. His research interests range from the investigation of fundamental physical processes (nonlinear optical activity, charge transport, light harvesting and emission) in organic-based nanostructured thin films, to the design, fabrication and testing of light-weight flexible optoelectronic devices based on hybrid printable materials. He serves as Associate Director of the Center for Organic Photonics and Electronics. He was born and raised in Alsace, France. He studied at the University Louis Pasteur in Strasbourg where he received a Maitrise in Solid-State Physics in 1985, and a Ph.D. in Nonlinear Optics in 1990. From 1990 to 1997 he was Chargé de Recherches at the French CNRS. In 1994, he joined the faculty of the Optical Sciences Center at the University of Arizona. He joined Georgia Tech in 2003. He holds ten patents and has co-authored over 400 scientific communications, including 165 refereed journal publications and eleven book chapters. He served as chair and co-chair of numerous international conferences on organic optoelectronic materials and devices. He is the co-founder of several spin-off companies. He is a Fellow of the Optical Society of America and of SPIE. His is an Associate Editor of *Optics Express*.

Ultrafast Nonlinear Optics on a Chip: Breaking the Terabit per Second Barrier

Benjamin J. Eggleton, Univ. of Sydney, Australia

This talk will review our progress on developing photonic integrated circuits based on breakthroughs in highly nonlinear materials and nanophotonics. We have demonstrated ultrafast information processing in a monolithic integrated photonic chip with terabit per-second bandwidth. Our approach takes advantage of different ultrafast nonlinear processes, such as four-wave-mixing and stimulated Raman scattering processes and also exploits dispersion engineering and slow-light effects. We will present our recent record-breaking results demonstrating information processing at terabit per second

speeds and will discuss prospects for implementation in next generation high bandwidth information systems.

Benjamin J. Eggleton obtained the Bachelor's degree (with honors) in science and the Ph.D. degree in physics from the University of Sydney, Sydney, N.S.W., Australia, in 1992 and 1996, respectively. In 1996, he joined Bell Laboratories, Lucent Technologies as a Postdoctoral Member of Staff, and was then transferred to the Department of Optical Fiber Research. In 2000, he was promoted to Research Director within the Specialty Fiber Business Division, where he was engaged in forward-looking research supporting Lucent Technologies business in optical fiber devices. Currently, he is an ARC Federation Fellow and Professor of Physics at the University of Sydney, Research Director of the Centre for Ultrahigh-Bandwidth Devices for Optical Systems (CUDOS), and Director of the Institute of Photonics and Optical Science (IPOS) University of Sydney. He is the author or coauthor of more than 250 journal publications and numerous conference papers. His current research interests include nonlinear optics, all-optical signal processing, optical communications, photonic crystals, photofluidics, and supercontinuum. Prof. Eggleton is a Fellow of the Optical Society of America and the Australian Academy of Technological Sciences and Engineering (ATSE). He was the recipient of the Pawsey Medal from the Australian Academy of Science, the 2004 Malcolm McIntosh Prize for Physical Scientist of the Year, the 2003 International Commission on Optics (ICO) Prize, the 1998 Adolph Lomb Medal from the Optical Society of America, the Distinguished Lecturer Award from the IEEE/Lasers and Electro-Optics Society, and an R&D100 Award. Wellkom in Brussels! Bienvenue à Bruxelles!

Brussels is the thriving centre of Europe, and as the new venue of SPIE Photonics Europe, THE SQUARE Conference Centre is right in the heart of it. It is just a short stroll from all of the historic city's major attractions with over 13,000 hotel rooms just around the corner, plus the pick of the city's restaurants, bars, and shops. Brussels is home to the European Commission, Parliament and NATO, a buzzing, influential city where history is made. The city is a key European commercial hub, too, and a base for many progressive international companies. But more than that, Brussels is a diverse and rich cultural centre, steeped in history, yet always ready to embrace the new, as its eclectic architecture demonstrates. Galleries and museums of all sorts abound, and there's a thriving comic-book scene built on the legacy of Hergé, the creator of Tintin.

THE SQUARE is located in Mont des Arts, the lively cultural quarter. For further information on things to do and events, please contact the Belgian Tourist Office at:
