The Nano Revolution: Bottom-up Manufacturing with Biomolecules

Jonathan Trent, Univ. of California/Santa Cruz and NASA Ames Research Ctr., USA

As the nano-scale becomes a focus for engineering electronic, photonic, medical, and other important devices, an unprecedented role for biomolecules is emerging to address one of the most formidable problems in nano-manufacturing: precise manipulation and organization of matter on the nano-scale. Biomolecules are a solution to this problem because they themselves are nanoscale particles

with intrinsic properties that allow them to precisely self-assemble and self-organize into the amazing diversity of structures observed in nature. Indeed, there is ample evidence that the combination of self-assembly with mutation, selection, and replication has the potential to create structures that could truly revolutionize manufacturing processes in many sectors of industry. Genetically engineered biomolecules are already being used to make the next generation of nano-scale templates, nano-detailed masks, and molecular scaffolds for the future manufacturing of electronic devices, medical diagnostic tools, and chemical engineering interfaces. This presentation will explore the feasibility of this approach, using examples from the Protein Nanotechnology Group at NASA Ames, which is using proteins to create flash memory devices for data storage, pathogen sensors for medical diagnostics, and enzyme arrays to help solve the impending energy crisis.

Biography: **Jonathan Trent** is currently a senior scientist at NASA Ames Research Center, where he leads the Protein Nanotechnology Group and is an Adjunct Professor in the Biomolecular Engineering Department at U.C. Santa Cruz. For over twenty years, he has studied the physical and chemical limits of life, the organisms that define those limits known as "extremophiles," and the structure and function of biomolecules produced by extremophiles. For the last eight years, his group at NASA Ames Research Center has focused on using extremophilic biomolecules for applications in nanotechnology. Dr. Trent has lectured extensively in the US and Europe and has published in many International Journals. In 2006, he received the Nano50 award for Innovation in Nanotechnology and was elected a Fellow of the California Academy of Sciences for his contributions in Astrobiology, Marine Biology, and Microbiology.

After receiving his Ph.D. in Biological Oceanography at Scripps Institution of Oceanography, Dr. Trent spent six years in Europe at the Max Planck Institute for Biochemistry in Germany, the University of Copenhagen in Denmark, and the University of Paris at Orsay in France. He returned to the U.S.A. to work at the Boyer Center for Molecular Medicine at Yale Medical School before establishing a biotechnology group at Argonne National Laboratory. In 1998 he moved to NASA Ames Research Center to be part of NASA's Astrobiology Programme and in 1999 he established the Protein Nanotechnology Group. In addition to working at NASA, he is an Adjunct Professor in the Dept. of Biomolecular Engineering at UC Santa Cruz.

Research in Micro- Nano- Technology and Systems: a European Perspective. Opportunities in Framework Programme 7: 2007-2013

Griet Van Caenegem, European Commission, DG Information & Media: Micro- and Nanosystems, Belgium

The area which started with MEMS devices has grown into an area of Microsystems and Micro Nano Technology for a wide set of applications. Today researchers from various disciplines are working together to achieve the objectives of research in the MST field. The new instruments IPs and NoEs will help to coordinate research in an integrated manner, ranging from feasibility to industrialisation. Technologies are converging while the MST field is expanding to the field of 'Smart Integrated Systems'.

In the future the 7th Framework and the further coordination of national or regional initiatives will help to realise the research agenda for this strategic field for Europe. The presentation will give some results of ongoing initiatives, some visions and an outlook for the future. The most recent information known for Framework Programme 7 and the calls for proposals will be presented. The presentation will mainly cover the priority NMP and the priority IST. The focus will be towards micro and nano electronics, photonics, micro and nanosystems and organic electronics with displays. The related European Technology Platforms will be presented as well.

Biography: **Griet Van Caenegem** has obtained her degree of Engineer in Physics from the university of Gent, Belgium in 1994. She has been working with Alcatel for 7 years and has joined the European Commission in 2001 in the unit of Micro- and Nano Systems. One of the responsibilities of the EC Scientific Officers is organising workshops and consultation meetings in order to define the strategy for the research in the area for the upcoming years. We are in charge of the evaluation process of proposals and once we finalise the negotiation process, we do monitor with external experts the progress of the EU funded projects.

The Final Frontier: Addressing the Global Challenge of Terahertz Frequencies

Derek Abbott, Univ. of Adelaide, Australia

Terahertz (T-ray) radiation has traditionally been an inaccessible part of the electromagnetic spectrum. Recent advances in femtosecond lasers have enabled the emergence T-rays as a safe imaging technology, which can identify substances non-invasively, as molecular vibrational modes tend to be in this frequency range. This talk will present the exciting global challenge for terahertz frequencies in terms of imaging, sensing, and short-path

communications—leading to applications in pharmaceutical development, biochips, aerospace, and defence security. Historically, industry is transformed whenever a new part of the spectrum is accessed: T-rays are at the next frontier.

Biography: **Derek Abbott** is with The University of Adelaide, where he is presently the Director of the Centre for Biomedical Engineering (CBME) and full professor within the Scholl of Electrical & Electronic Engineering. His work has received scientific reportage in *New Scientist*, *The Sciences*, *Scientific American*, *Nature*, *The New York Times*, and *Sciences et Avenir* and he holds over 300 publications/patents. Prof Abbott has been an invited speaker at over 80 institutions around the world, including Princeton, NJ; MIT, MA; Santa Fe Institute, NM; Los Alamos National Laboratories, NM; Cambridge, U.K.; and EPFL, Lausanne, Switzerland. He won the GEC Bursary (1977), the Stephen Cole the Elder Prize for scholarship (1998), the E.R.H. Tiekink Memorial Award for scientific publication activity (2002), a Tall Poppy Award for Science (2004) and the Premier's SA Great Award in Science & Technology for outstanding contributions to South Australia (2004). He has served as an editor and/or guest editor for a number of journals including *Chaos* (AIP), *Smart Structures and Materials* (IOP), *Journal of Optics B* (IOP), *Microelectronics Journal* (Elsevier), *Proceedings of the IEEE*, and *Fluctuation Noise Letters* (World Scientific). He is a chartered physicist and Life Fellow of the Institute of Physics (IOP). He is also a chartered engineer and Fellow of the Institution of Electrical & Electronic Engineers (IIEE).
