Welcome to Medical Imaging 2006, the premier annual meeting on the scientific and technical aspects of medical imaging. This year's meeting features technical presentations on the most up-to-date research and development in the areas of image visualization, display and image-guided procedures; physics of medical imaging; physiology, function, and structure from medical images; image processing; PACS and imaging informatics; image perception, observer performance, and technology assessment; and ultrasonic imaging and signal processing. In the plenary presentation, Dr. Jonathan C. Newell, Department of Biomedical Engineering, Rensselaer Polytechnic Institute, will present "Electrical Impedance Imaging: an Idea Whose Time May Soon Come" (see page 5). Included with your registration fee. In-depth topical workshops will be offered in conjunction with several conferences and are free to all registered attendees. A set of professional development courses complements the symposium program. Most courses are held on the Saturday before the symposium to give you the opportunity to stay current with the latest technologies without interfering with any of the conference presentations. In addition to the scientific program, a product exhibition will again be part of the symposium. The exhibits offer interested delegates the opportunity to learn more about the latest components and systems related to medical imaging.

Electrical Impedance Imaging: an Idea Whose Time May Soon Come

Town & Country Room - Monday, 4:00 pm

Jonathan C. Newell, Ph.D., Rensselaer Polytechnic Institute

Jonathan C. Newell received B.S. and M.S. degrees in electrical engineering from Rensselaer Polytechnic Institute, and the Ph.D. degree in physiology from the Albany Medical College, in 1974. He then joined the faculty of Rensselaer Polytechnic Institute, where he is now Professor of Biomedical Engineering. He

has also been a Professor of Physiology at the Albany Medical College. His recent research work has been the development of an adaptive system for electrical impedance imaging. In 1993, this work was awarded the Computerworld/Smithsonian Award in Medicine. He is author or co-author of 85 papers in the peer-reviewed literature, and 50 abstracts and similar publications. He has presented his research work in eight countries.

Dr. Newell has been an Associate Editor for the IEEE Transactions on Medical Imaging, and serves as a reviewer of research papers and grants for the NIH, NSF and other US and international journals and agencies.

The formation of images of the body's electrical properties from measurements made at the surface is called Electrical Impedance Imaging. This usually requires attaching many electrodes to the skin in the area of interest, applying currents and measuring the resulting voltages. From these data, sophisticated reconstruction algorithms are applied to solve the

inverse problem, and report the complex conductivity in the volume enclosed by the electrodes. This technology has several advantages over other imaging techniques, and several important limitations. It examines tissue conductivity and permittivity over a potentially wide range of temporal frequencies, typically between a few hundred Hz to above 1 MHz. When many frequencies are studied together, the term Impedance Spectroscopy has been used. These electrical properties, which may contain diagnostic information, are not assessed by other imaging modalities. For example, the impedance of breast tumors differs by a factor of 7-10 from that of normal breasts. Impedance images showing ventilation of the lungs, and blood volume changes in the heart and lungs, can be displayed continuously at the bedside of the critically ill, allowing risk-free continuous monitoring.

After 20 years of development, there remain a myriad of unanswered questions. There are theoretical questions about how to address the ill-posed non-linear reconstruction problem in the presence of the kinds and levels of noise that actually exist. There are practical questions about the number of electrodes that can be built and applied to different regions, and the trade-off between speed, complexity and noise levels in the electronics and electrode connections. There are clinical questions about the indications for this imaging technology, and ultimately its cost-effectiveness. Its cost could be low, but its effectiveness is yet to be demonstrated.

“Meet the NIH” Sessions

The Grants Process at NIH

Golden West Room · Sunday 5:45 to 7:45 pm

Moderator: Lee A. Rosen, Ph.D., Scientific Review Administrator, Biomedical Imaging Technology Study Section, Center for Scientific Review, National Institutes of Health/HHS

The National Institutes of Health (NIH) is a major source of basic research support to academia and industry for the development of new technology for medical imaging. At the 2005 Medical Imaging meeting, representatives of five top funding institutes presented details of their areas of interest and new directions in imaging technology. However, to get support, one must prepare a grant application, and the artform of preparing such an application and how they are evaluated at NIH remains a mystery to many. The process of evaluation is called Peer Review and is the means by which NIH is able to evaluate and select the best science for funding, and in turn provide constructive feedback and guidance to those who are not successful. This planned session at the SPIE Medical Imaging meeting will focus on two points, the art of grantsmanship and how grant applications are evaluated through peer review. Members of the SPIE Medical Imaging community will provide thoughts and insights into the preparation of applications for NIH support, and an NIH representative who manages grant reviews for imaging technology will speak on the process of peer review. The objective of this workshop would be to provide some idea of the grantsmanship effort and what NIH study section reviewers are looking for in a successful grant application. Two speakers will be members of the academic environment who are also successful grantees with previous experience in review as permanent members study sections. In addition, for those in the private sector in small businesses, a third talk will involve the process by which they can also apply for grant support under the Small Business Innovative Research Program. Discussions will include what considerations are important in preparing a grant application, in amending one, and with new issues in human subjects and budgets.

Academic speakers will include John Boone, Ph.D., Professor and Vice Chair, Department of Radiology, Univ. of California, Davis, and Elizabeth Krupinski, Ph.D., Research Professor, Department of Radiology, Univ. of Arizona, speaking respectively on considerations of preparing an application for basic research and on revising an initially unsuccessful one. In addition, Robert Fagaly, Vice President, Tristan Technologies, San Diego, California, will speak on preparing applications for small business research support.

NIH One-on-One Forum

Royal Palm I Room · Monday 9:00 to 11:30 am

This session will provide an opportunity to meet with representatives of Center for Scientific Review and of at least three of the main imaging technology funding Institutes of NIH on a one on one basis to ask specific individual questions.

NCI Lung Image Database Consortium (LIDC): Open Meeting

San Diego Room · Sunday 6:45 to 7:45 pm

Academic Chairs: Samuel G. Armato III, Univ. of Chicago; **Geoffrey McLennan**, Univ. of Iowa
NCI Program staff: Barbara Croft and **Laurence P. Clarke**, Cancer Imaging Program, National Cancer Institute

Overview: The mission of the NCI supported Lung Image Database Consortium (LIDC) is sharing of lung images, especially low-dose helical CT scans of adults screened for lung cancer, and related technical and clinical data for development and testing of computer-aided diagnosis technology.

Principal Goals of the LIDC: To establish standard formats and processes for managing lung images and related technical and clinical data for use in the development and testing of computer-aided diagnostic (CAD) algorithms; and to develop an image database as a web-accessible international research resource for the development, training, and evaluation of CAD methods for lung cancer detection and diagnosis using helical CT.

LIDC Open Meeting Agenda: The agenda will include several presentations by members of the steering committee on the progress made by this consortium to be followed by an open forum that will solicit input from attendees of this meeting. The scope will include the results of a consensus process for the imaging protocol, collection of cases for this database, results of comparison of methods for the determination of the boundaries of nodules, development of a nodule visual library, and planned release of image data.

CT Colonography Database Workshop

Royal Palm I Room · Tuesday 5:45 to 6:45 pm

Description: CT colonography image databases are becoming available for research purposes. The purpose of this informal discussion group is to share ideas about annotating and making use of these databases. This workshop will be of great interest to both academic and commercial organizations developing and validating CT colonography computer-aided polyp detection (CAD) systems. A proposal for a CAD “bake-off” (competition) will also be discussed.

Poster Awards

Monday and Wednesday at 6:30 pm

Grand Ballroom Poster Area

This year’s poster awards will be presented at 6:30 pm on Monday and Wednesday during the poster receptions. Award ribbons will be displayed on the winning posters at the poster receptions on those evenings. Each conference will recognize selected poster papers of exceptional quality at either the Cum Laude or Honorable Mention level. Winners will be chosen by members of individual conference program committees. In addition, cum laude poster award recipients will be recognized in the Proceedings of SPIE volumes. If authors agree, the first place winners’ posters will be on display the following day outside the conference rooms.

Recognition levels:

Each conference will recognize a selected poster at the cum laude level in each poster session for the quality of work presented and for the presentation itself. A number of posters, limited to no more than five to ten percent of the best posters presented, will receive honorable mention.

Basis for selection:

1. Work should be of a standard of excellence as judged by the quality and quantity of results presented. It should include results that are both significant and new to the field of study. Conclusions should be well supported by the results, and relevant references should be cited.
2. Presentation should be well organized, clear, and concise. It should be self-contained, giving adequate background, concise results, and relevant references. Graphic design will be considered only to the extent that it contributes to the clarity of presentation.
3. A conference may give preference to first authors who are students or who are within five years of their terminal degrees.

Cerebrovascular Modeling and Simulation

Speakers: **Fernando Vinuela**, Univ. of California/Los Angeles, **Alessandro F. Frangi**, Univ. Pompeu Fabra (Spain), **Charles A. Taylor**, Stanford Univ., **Juan R. Cebal**, George Mason Univ., **Juan Lasheras**, Univ. of California/San Diego, **Daniel J. Valentino**, Univ. of California/Los Angeles

Cerebrovascular disease is a leading cause of death and permanent disability. Cerebrovascular anatomy, hemodynamics and biomechanics are all important in evaluating the extent and severity of disease, in planning treatment, monitoring progress, and evaluating outcomes. However, relatively little is known about the contribution and relative significance of these factors. Numerical simulations using imaging-based, patient-specific models of cerebrovascular disease are now the subject of intense research interest. It is important and timely to discuss the latest research results, understand their limitations, and identify the challenges that remain. This special workshop will bring together some of the leading researchers in this area to discuss the clinical rationale for cerebrovascular simulation, current segmentation and modeling techniques, different simulation techniques, validation and evaluation studies and analyses of error, and the computational challenges limiting research in this field.

Measures of Physical Performance for X-ray Imaging Systems*Chair: Ehsan Samei, Duke Univ.*

Current methods to measure the resolution and noise characteristics of x-ray imaging systems are described by a panel of experts. The IEC standard method for measuring the MTF, NPS, and DQE will be summarized and practical suggestions made on how to apply the methods. The materials and software needed will be identified. Emerging issues with respect to temporal response and system response will be discussed. For computed tomography systems, methods to measure MTF and NPS will be described and illustrated.

Image Processing
Conference 6144

Golden West Room · Tues. 5:45 to 7:45 pm

Evaluation of Image Segmentation

Speakers: Jayaram K. Udupa, Univ. of Pennsylvania; Guido Gerig, The Univ. of North Carolina System; Simon K. Warfield, Brigham and Women's Hospital

Image segmentation is one of the most crucial image processing operations that is required in almost any image analysis task. Since many other seemingly unrelated operations, such as image interpolation, filtering, registration, compression, display, and rendering, depend on the availability of object information for their effectiveness, they also depend, although somewhat indirectly, on segmentation. While, justifiably, a great deal of emphasis has been laid on the segmentation problem during the past 4 decades, the related issues of how to evaluate its solutions, and compare among the solutions in an exchangeable, standard manner that is acceptable to the scientific community at large have received far less attention.

In this workshop, there will be three presentations. Each speaker will present his perspective on the problems encountered in evaluating segmentation methods, the solutions as he sees fit, and the issues to be addressed as they pertain to the community at large. This will be followed by a discussion of several salient issues that have been considered by the speakers to be the most crucial in addressing segmentation evaluation.

How Experts Interpret Images: An Interactive Panel of Radiologists

Panelists: Harold L. Kundel, Univ. of Pennsylvania; Eliot L. Siegel, Veterans Affairs Medical Ctr.; Ronald M. Summers, National Institutes of Health; Steven C. Hori, Univ. of Pennsylvania

Image interpretation is at the core of radiology and is a critical component of medical imaging. It is important to understand how radiologists perceive and interpret images. However, the complexity involved makes it challenging to understand exactly how radiologists interpret images. In this workshop, a panel of radiologists will interpret a series of example cases, some of which will be difficult, with narration and discussion, to reveal the perception and thought process involved in searching for abnormalities and making a diagnosis. This exercise may provide insights to the understanding of the image-interpretation process and fresh perspectives to researchers who analyze images with a computer.

Volumetric Reconstruction for X-ray CT

Speaker: **Andy Ziegler**,
Philips GmbH (Germany)

Methods to reconstruct 3D computed tomography (CT) image data from multi-slice and cone-beam x-ray CT systems are explained and compared. Experts will outline methods for those not familiar with image reconstruction, provide programming examples for those having some familiarity with software, and illustrate the performance achieved with specific solutions. Methods considered will include filtered-backprojection and iterative solutions suitable for cone-beam acquisitions with either circular or helical trajectories. Available public domain software and acceleration hardware will be identified.
