Special Collocated EU Network Meetings

EU Network of Excellence PHOREMOST

Room: Dresde

Thursday 6 April 16.00 to 18.00
Friday 7 April 08.30 to 16.00

PHOREMOST ("Nanophotonics to realise molecular scale technology" -www.phoremot.org) integrates the activities in the nanophotonics area of 34 partners from universities, research centres and industry to address the near- and long-term needs of photonic functional components. It builds on the critical mass existing in Europe in this emerging area, rapidly developing as a result of the concomitant progress in nanostructured materials, nanofabrication technologies, nano-scale characterisation techniques, novel concepts linking electromagnetic radiation in electronic and optical systems, recent concepts involving optical properties of non-periodic, fractal and quasi-crystal structures, as well as a better understanding of non-linear properties of molecules. The main driving force behind nanophotonics is the expectation to access the molecular scale dispensing with electrical contacts.

The meeting of PHOREMOST Network will take place on Thursday 6th - Friday 7th April 2006. The purpose of this meeting is to review the scientific progress made at the WP level and to highlight the integration, education and training and dissemination activities.

All 34 partners will have an opportunity to present their research where their team is world class within the scope of PHOREMOST and identify topics, themes, techniques, etc., where they seek partnerships to enhance the added value of joint research at the European level.

MONA workshop on materials and equipment for nanophotonics

Competing with incandescence: methods for achieving efficient solid state lighting using organic light-emitting devices**Stephen Forrest**, Univ. of Michigan, USA

A significant challenge facing human kind in the 21st Century is how to address the ever decreasing supply of depletable and renewable energy. One approach to this problem is to decrease our usage. For this reason, considerable attention has been focused on more efficient means for room lighting which currently consumes approximately 20% of the total energy used. Organic light emitting devices (OLEDs) provide a unique opportunity to provide

this high efficiency solid state lighting at very low cost. In this talk, I will discuss several strategies for achieving very high efficiency white light emission at high brightnesses for the next generation of efficient solid state lighting sources based on small molecular weight, vapor deposited OLED structures. Key to our approach is the use of electrophosphorescence as a means for converting all electrical into optical energy. We show that the highest luminance efficiencies can be obtained by a combination of fluorescence and phosphorescence in a unique OLED structure. Furthermore, the highest brightnesses are achieved (without a significant loss in power efficiency) by stacking several fluorescent/phosphorescent elements in a single OLED structure (called a SOLED), with each emitting element in the stack separated by a transparent charge generation layer. Prospects for OLEDs as the next practical generation of interior illumination sources will be reviewed.

Biography: **Stephen Forrest** received B.A. Physics in 1972 at the University of California, and MSc and Ph.D. Physics in 1974 and 1979 at the University of Michigan. He served as director of the National Center for Integrated Photonic Technology, and as Director of Princeton's Center for Photonics and Optoelectronic Materials (POEM). From 1997-2001, he served as the Chair of the Princeton's Electrical Engineering Department. Risk mitigation in spaceborne lasers**Yngve Lien**, European Space Agency/ESTEC, The Netherlands

Spaceborne lidars carry much promise for Earth observation and interplanetary missions to measure atmospheric parameters (wind velocity, optical extinction or species concentrations) and the planet topology. As the first European lidar mission, the European Space Agency is developing a Doppler wind lidar, to be launched on board ADM-Aeolus in 2008. ALADIN will carry a pulsed UV laser, emitting about 120 mJ of pulse

energy. The mission duration is envisaged three-years, which corresponds to several billion emitted pulses, thus imposing very stringent criteria on the longevity of the system. Laser-induced damage is one of the significant issues here, in particular since laser-induced damage in space vacuum is still poorly understood. The European Space Agency has therefore established a test campaign to measure the power handling of all the instrument optics with laboratories in Germany, Italy, the Netherlands and France participating. Measurements are being conducted on all critical optics for all three wavelengths (1064nm, 532nm and 355nm) and with the introduction of several contaminants. The presentation will cover laser-induced damage risk mitigation, the ESA test campaign and the test results.

Biography: **Yngve Lien** was born in Trondheim, Norway, on the 26th of October 1974. In 1994 he started his undergraduate degree in Physics at Imperial College in London and graduated with a Master's degree in 1998. Turning his interest to quantum noise in Nd:YVO microchip lasers at the University of Leiden in the Netherlands, he defended his thesis "Intensity dynamics of slow-inversion lasers" in November 2002. Since then he has been working in the Opto-electronics section for the European Space Agency, where he supports the ADM-Aeolus project to launch a spaceborne Doppler wind lidar in 2008. To qualify the optics with respect to their laser-induced damage threshold, he helped to start a test campaign involving laboratories in several European countries. As part of this work, he set up an internal laser-induced test laboratory for ESA at ESTEC.

Silicon-on-insulator microphotonic devices**Laurent Vivien**, Univ. Paris Sud CNRS, France

Coauthors: **E. Cassan, D. Marris, S. Maine**, Univ. Paris Sud CNRS (France); **M. Rouvière**, Univ. Paris Sud CNRS and STMicroelectronics (France); **A. Lupu, D. Pascal, X. Le Roux, S. Laval**, Univ. Paris Sud CNRS (France); **J.-F. Damlencourt, J.-M. Fédéli**, GEA-DRT/LETI (France)

Silicon-on-insulator substrates (SOI) have generated an increasing interest in the recent years, for both nanophotonic and nanoelectronic applications. The thin crystalline silicon film which is separated from the silicon substrate by a buried oxide layer constitutes a high quality optical waveguide at telecommunication wavelengths (from 1.3 μm to 1.6 μm) where silicon is transparent. A very strong light confinement is obtained with SOI structures, due to the large refractive index difference between silicon and its oxide ($n_{\text{Si}} \approx 3.5$, $n_{\text{SiO}_2} \approx 1.45$). This allows the realization of ultra-compact nanophotonic devices and circuits. Monolithic integration of optical functions with microelectronic circuits at the same level will offer new possibilities for low cost and reliable devices. The main forecast applications of silicon nanophotonics are on-chip optical interconnects and optical telecommunications. However, a number of fundamental challenges has to be addressed before this technology can successfully be used either to solve current microelectronic bottlenecks or to compete with III/V semiconductor components. Low loss light distribution and fast integrated optoelectronic devices are required. For telecom applications, additional conditions of polarization insensitivity and low insertion loss with optical fiber have to be fulfilled.

Various geometries of SOI microwaveguides and the associated devices for light distribution (splitters, turns, etc.) will be compared. Light injection in submicron SOI waveguides will be discussed. Emphasis will be put on rib SOI waveguides obtained by shallow etching of the silicon film, which offer advantages for the integration of active devices while fulfilling efficiency and compactness. Propagation losses of such waveguides are one order of magnitude smaller than for single mode strip waveguides. Rib-based compact and low loss optical signal distribution from one input to up to 1024 output points has been demonstrated. The indirect bandgap of silicon is not in favour of light emission and modulation. Realization of silicon sources and high speed and efficient silicon-based modulators is a real challenge. For light detection, germanium can be grown on silicon and Ge photodetectors with acceptable responsivity and bandwidth close to 40 GHz have been demonstrated.

Biography: **Laurent Vivien** received his Ph.D. entitled "Nonlinear optical properties of carbon nanotubes for optical limiting" at the Ecole Polytechnique, Palaiseau, France, in July 2001. Since 2001 he has been working at the Institut d'Electronique Fondamentale (IEF, Orsay/France). His activities are devoted to silicon nanophotonics. He is involved in the development of both passive silicon-on-insulator devices (optical couplers, waveguides, splitters and turns) and integrated optoelectronic silicon-based components, in particular optical modulators and Ge on Si photodetectors for optical interconnects and optical fiber communications.

Engineering and characterization of ferroelectric microstructures for photonic crystal applications**S. Grilli**, Istituto Nazionale di Ottica Applicata, CNR, Italy

Coauthors: **P. Ferraro, L. Sansone, M. Paturzo, D. Alfieri, P. De Natale**, Istituto Nazionale di Ottica Applicata, CNR (Italy); **S. De Nicola, G. Pierattini**, Istituto di Cibernetica "E. Caianiello," CNR (Italy)

Lithium niobate (LN) is a ferroelectric crystal of considerable interest to the optical, laser and communications industry, due to its large values of nonlinear optical, electro-optic, piezoelectric

and acousto-optical coefficients. LN is largely used in the field of optics for laser frequency conversion processes by quasi-phase matching approach through the periodic modulation of the nonlinearity while in the microwave or telecommunications sector it is widely used for surface acoustic devices and integrated optical modulators. A wide variety of techniques have been reported in literature for LN micro-machining and microstructuring, including reactive ion etching, laser ablation, or laser assisted chemical etching. Wet etching by hydrofluoric and nitric acid solutions has also been used for many years to reveal reversed ferroelectric domains and defect structures in LN and it has been used recently to intentionally produce ordered microstructures, subsequent to periodic domain inversion. Such microstructuring can find interesting applications for example in the fields of optics and optoelectronics for ridge waveguides, alignment structures, V-grooves, micro-tips but also for Bragg reflectors or photonic bandgap devices. Ferroelectric domain engineering by electric field poling (EFP) technique represents a key process for all of these applications, so that a thorough understanding of material and poling related properties, as well as accurate topography characterization of the fabricated microstructures, are of fundamental importance.

Digital Holography (DH) based techniques are presented here for topography measurements of surface engineered structures and for characterization of LN EFP related properties. In the first case DH technique has been used for wide field amplitude and phase imaging of surface isolated and periodic structures with quantitative information about their topographic features through the two-dimensional (2D) distribution of the optical path difference. A Mach-Zehnder type interferometer in microscope configuration has been used for acquiring holograms of the object that are subsequently subjected to DH numerical calculations which provide amplitude and phase reconstruction of the object wavefield. In case of EFP related properties, in-situ characterization of domain reversal process, during external voltage application, has been carried out by DH reconstruction of the in-focus 2D phase shift distribution experienced by the object beam traversing the sample along the z crystal axis, due to the linear electro-optic and piezoelectric effects. The behaviour of independently growing and merging ferroelectric domains during EFP has been studied to investigate the dynamic characteristics of LN ferroelectric domain switching. Compared to other interferometric methods, DH provides the basic advantage to recover the in-focus phase image of the object by post-process numerical procedure, extremely useful in case of EFP dynamic events. Moreover DH technique has been used for direct investigation and evaluation of the so called internal field, a well known typical property of congruently melted LN material and partially responsible for lack of uniformities in periodic domain engineering. Intrinsic composition related local defects can be detected by DH through electro-optic effect analysis.

Moreover, recent novel results concerning nanoscale periodic surface structuring of congruent LN are shown here. Holographic lithography (HL) is used to obtain sub-micron period 1D and 2D insulating patterns which are transferred into the material as reversed domain patterns by EFP and afterwards as surface structures by subsequent polarity selective wet etching. Moiré beating effect has been used in the HL process to fabricate complicated structures consisting of double period 2D or combination of 1D and 2D geometries. Accurate atomic force microscope (AFM) topographic characterization of the fabricated structures is presented, showing that periods and structure sizes down to 700 nm and 200 nm, respectively, with depths of few microns, have been obtained. The depth compatibility with waveguide implementation allows to foresee possible applications of these structures for Bragg grating or innovative photonic crystal devices, exploiting the additional nonlinear and electro-optic properties typical of LN. Moreover, novel results concerning double-face sub-micron period surface structuring of LN substrates are presented to show the possibility to have twice as many devices on the same chip, thus increasing the integration capability.

About Photonics²¹

The European Technology Platform Photonics²¹ was set up as a result of consultations between high-level representatives of the European photonics industry, Viviane Reding, European Commissioner for Information Society and Media, and the Commissioner for Research, Janez Potočnik. Photonics²¹ is based on the vision document "Photonics for the 21st Century", which has been published in spring, 2005 and which proposes a coordinated action plan at the European level to explore the nearly limitless future applications of light and to reap the expected benefits in terms of creating both jobs and wealth.

Through a shared vision between industrial and public actors, it aims to create the critical environment necessary for visionary and industrially relevant R&D in photonic components, systems and applications. The Platform undertakes to establish Europe as a leader in the development and deployment of Photonics in key industrial areas (Information and Communication, Lighting and Displays, Manufacturing, Life Science, and Security) as well as in Education and Training.

Photonics²¹ is headed by the chairmen of internationally leading companies like Jenoptik, Bookham, TRUMPF Laser technology, Carl Zeiss, Philips Lighting and SAGEM.

The current president of Photonics²¹ is Alexander von Witzleben who is the CEO of Jenoptik and the vice-presidents are Bernd Schulte, President EPIC, CTO Aixtron, Paul Lagasse, IMEC, Director Intec Division and Malgorzata Kujawinska Head of Optical Engineering Division Warsaw University of Technology, and President SPIE 2005.

The Strategic Research Agenda

The purpose of the Strategic Research Agenda (SRA) is to set out medium- and long-term R&D priorities for Photonics, including measures for enhancing the R&D infrastructure in Europe as well as education and training issues. The detailed work of defining a SRA is undertaken by specialised working groups. The SRA is a living document and will be revised as required.

Following on from the SRA, Photonics²¹ has the aim developing a deployment strategy including mechanisms to mobilise the private and public investments which are needed to implement the SRA.

Nanophotonics: a research agenda from the perspective of the NoE PHOREMOST

Clivia M. Sotomayor Torres, Univ. College Cork, Tyndall National Institute, Ireland

The Network of Excellence "Nanophotonics to realise molecular-scale technologies@ (PHOREMOST) has developed a research agenda during its first year of activities. PHOREMOST addresses the near- and long-term needs of photonic functional components, building on the critical mass existing in Europe in this emerging area. This encompasses progress in nanostructured materials,

nanofabrication technologies, nano-scale characterisation techniques, novel concepts linking electromagnetic radiation in electronic and optical systems, recent concepts involving optical properties of non-periodic, fractal and quasi-crystal structures, as well as a better understanding of non-linear properties of molecules. The main driving force behind nanophotonics is the expectation to access the molecular scale dispensing with electrical contacts. In this talk, the research agenda in nanophotonics, as developed in PHOREMOST will be presented.

Biography: Professor Clivia M. Sotomayor Torres obtained her BSc. (Hons.) Physics in 1979 (Southampton University, UK) and her Dr. Phil. in Physics in 1984 (Manchester University, UK). During 1983-1984 she was a research assistant at the University of St. Andrews (UK). This appointment was followed by: 1984-87 Lecturer in Physics, St. Andrews University (UK), 1986-1996 Lecturer and Senior Lecturer in Electrical Engineering at the University Glasgow (UK). Clivia has received three prestigious awards from the Royal Society of Edinburgh, the Nuffield Foundation, and an Amelia Earhart Fellowship from ZONTA International (USA) in 1993, 1990 and 1982, respectively. From August 1996 to February 2004 she was Professor of Materials Sciences in Electronics at the University of Wuppertal, Germany. Since March 2004 she joined the then NMRC, now Tyndall National Institute, at University College Cork as a Research Professor, where she set up a new group on Photonic Nanostructures. Her research group is funded by research grants from the Science Foundation Ireland, the European Commission and the Volkswagen Foundation.

She carries out research in the field of science and engineering of optical nanostructures, especially novel lithography methods for their realisation, such as nanoimprint lithography, light propagation and emission in periodic and quasi-periodic media and more recently confined phonons in silicon-on-insulator thin films and nano-addressing using inorganic nanotubes. She is author of over 260 scientific publications and has edited six books.

She has participated in several EU projects since 1989, including, NANSDEV, PHANTOMS, ECAMI, CERION, NANOTECH, CHANIL and PHOBOS. She currently coordinates PHAT and serves on the Management Board of the Integrated Project "Emerging Nanopatterning Methods" (NaPa) as lead partner on nanoimprint lithography. Clivia is the coordinator of the EU IST Network of Excellence "Nanophotonics to realise molecular-scale technologies" (PHOREMOST).

The U.S. national nanotechnology infrastructure network and support of photonics research and development

Sandip Tiwari, Cornell Univ., USA

A major challenge in science and engineering research and development at the nano-scale, and particularly for photonics, is the availability of infrastructure that allows easy and quick implementation of structures, devices, or more complex systems necessary for making rigorous measurements, other exploratory directions of interest, and building of assemblies that utilize techniques from multiple disciplines. The experiments connect across length scales -

nanometers and up, employ a variety of materials and techniques of assembly and patterning, and require a complex mix of knowledge that are derived from other research areas and tools that are demanding in skills and are hard to access. The National Nanotechnology Infrastructure Network (NNIN; www.nnin.org) is funded by the National Science Foundation and is a partnership of open shared facilities across the country that enables the national community to pursue research and technology development that can benefit from nanotechnology. The NNIN provides easy hands-on access to external users, remote usage, staff support, low cost usage, knowledge infrastructure, and brings together an extensive coordinated array of instruments for fabrication, synthesis, and characterization together with other infrastructure resources. Particularly relevant to photonics is the ability to combine optical quality materials and fabrication techniques with ultra-sensitive characterization and application to biology, fluidics, and problems of interest in optical and electronic communication. Integration to the smallest length scales through synthesis and electron-beam lithography, growth and deposition of a variety materials with controlled properties, patterning of complex shapes in the three-dimensions, connecting such structures, characterization, and the ability to achieve this quickly and at low cost is essential to successful university research and industrial innovation. NNIN tool resources that span focused-ion beam, electron microscopy, spectroscopic techniques, etc. for characterization; synthesis, growth, deposition, etc. for assembling; ultra-high resolution lithography, etching, etc. for patterning - all enable the researcher to focus on their own research interest by leveraging the NNIN infrastructure. Access of NNIN is designed for ease of use - quick access (typically, 2 weeks), strong support (direct staff and web-based interactions), and remote execution for simple projects.

This talk will emphasize the character and practice within NNIN with reference to examples of academic and industrial research and development in photonics area.

Biography: Sandip Tiwari is Professor of Electrical and Computer Engineering and Charles N. Mellowes Professor in Engineering at Cornell University, and the Director of National Nanotechnology Infrastructure Network. His current research interests are in power-adaptive energy-efficient electronics, a path that leads through small devices and their circuits, newer approaches to CMOS structures, three-dimensional integration, ideas and technologies that allow functional integration, and in interesting offshoots of small structures in other areas. Among his contributions and inventions of note have been nanocrystal and quantum-dot low power memories, back-side trapping memories, vertical transistors-based memory approaches and the technology of heterostructure bipolar transistors. His theoretical efforts provided the fundamental understanding of several device phenomena including the electron injection processes in coupled confined systems, frequency limitations of quantum-wire lasers due to gain compression, and high current alloy barrier effects and surface recombination in heterojunction bipolar transistors. Sandip Tiwari has been a Research Staff Member and Manager for Exploratory Devices and Device Modeling at IBM, has held visiting and adjunct faculty appointments at the University of Michigan and Columbia University, is a Fellow of IEEE and APS, and received the Young Scientist Award of 1991 from Institute of Physics and the Distinguished Alumnus Award from IIT Kanpur in 2003. Current nanotechnology policy in Japan and photonic materials research at National Institute for Materials Science (NIMS), Japan

Speaker and Author: **Kenji Kitamura**, Director, Opto-Single Crystal Materials Research, National Institute for Materials Science, Japan

Co-Author: **Teruo Kishi**, President, National Institute for Materials Science, Japan

In March, 2001, the Second Science and Technology Basic Plan (2001-2005) was decided by the Council for Science and Technology Policy (CSTP). The plan assigns strategic priority in R&D to basic research and four prioritized areas in funding: life sciences, information and telecommunications, environmental sciences, and nanotechnology & materials science/technology. In nanotechnology & materials

science, CSTP exemplified five fields for application: information technology, environment, biotechnology, generic technology, and materials. Following this plan, the government funding for R&D on nanotechnology & materials science has been increased and reached JPY 94 billion in FY 2004.

The Ministry of Education, Culture, Sports, Science and Technology (MEXT) have several highlights of research programs such as the Leading Projects by MEXT, the Nanotechnology Virtual Laboratories by JST, the Focus 21 by METI, and the Nanomaterials and Processing Sub-Program by NEDO. Besides, for the promotion of inter-disciplinary collaboration and industrial application, the Nanotechnology Support Project (NSP) was started by MEXT in April, 2002, and the Nanotechnology Business Creation Initiative (NBCI) was founded with a help of METI in October, 2003. NSP provides informational support and common use facility support, for which the Nanotechnology Researchers Network Centre of Japan (Nanonet) was founded, and NBCI is the consortium of more than 300 private companies. There are also several programs for "clusters", regional industry-university-government networks, and centres of excellence, in which nanotechnology is one of the key technologies.

This talk will introduce the activities of NSP in details and recent research subjects on photonic materials performed in NIMS.

PV solar electricity: status and future

W. Hoffmann, SCHOTT Solar GmbH (Belgium); European Photovoltaic Industry Association Vice President, Schott Solar (Belgium)

Within the four main market segments of PV solar electricity there are already three areas competitive today. These are off-grid industrial and rural as well as consumer applications. Within the fourth market segment of grid connected systems there has been a profound increase starting in USA in the 80ies, followed

by Japan in the mid 90ies and Europe, in particular Germany, in 2000. The overall growth within the past 6 years was almost 40 % p.a. with a "normal" growth of about 15 % p.a. for the first three market segments whereas the grid connected market increased with an astonishing 60 % p.a. The different growth rates catapulted the contribution of grid connected systems in relation to the total market from about one quarter 6 years ago towards more than three quarters today. The reason for this development is basically due to industry-politically induced market support programs in the aforementioned countries. It is quite important to outline under which boundary conditions grid connected systems will be competitive without support programs like the feed in tariff system in Germany, Spain and some more to come in Europe as well as investment subsidies in Japan, US and some other countries. It will be shown that in a more and more liberalized utility market worldwide electricity produced by PV solar electricity systems will be able to compete with their generating cost against peak power prices from utilities. This situation is most likely to happen within the next 10 years more southern areas (1,500 - 1,800 kWh/kWp) while it may take about 10 years in more in places like Germany (800 - 1,000 kWh/kWp). The point of time for this competitiveness is mainly determined by the following facts:

- Pricedecrease for PV solar electricity systems leading to an equivalent decrease in the generated cost for PV produced kWh
- Development of a truly liberalized electricity market
- Degree of irradiation between times of peak power demand and delivery of PV electricity

The first topic is discussed using price experience curves. Some explanations will be given to correlate the qualitative number of 20 % price decrease for doubling cumulative worldwide sales derived from the historic price experience curve with a more quantitative analysis based on our EPIA-Roadmap (productivity increase and ongoing improvements for existing technologies as well as development of new concepts to broaden the product portfolio in coming years).

The second topic outlines the most likely development of liberalized electricity markets in various regions worldwide. It will be emphasized that in such markets the future prices for electricity will more and more reflect the different cost for bulk and peak power production. This will not only happen for industrial electricity customers - as already today in many countries - but also for private households.

The third topic summarizes the existing data and facts by correlating peak power demand and prices traded in various stock exchange markets with delivered PV kWhs. It will be shown that a high degree of correlation is existent.

Combining the three topics and postulating reverse net metering the competitiveness of PV solar electricity as described is most likely to occur. The described price decrease of modules will also have a very positive impact on off-grid rural applications, mainly in 3rd world countries. It will be shown that this is strongly advanced due to the development of mini-grids starting from solar home systems - with mini grids looking very similar to on-grid applications in weak grid areas of nowadays electricity network.

Biography: **Dr. Winfried Hoffmann** graduated in physics - diploma in superconductivity - and did his PhDthesis in biophysics. After a 3 year's senior lectureship at the University of London (laser flash photolysis in biochemistry) he joined the just formed photovoltaic R & D group of NUKEM in 1979 and took over its leadership in 1985.

He initiated the Joint-Venture in the photovoltaic field between NUKEM and Daimler-Benz Aerospace to form "Angewandte Solarenergie - ASE GmbH" in 1994 and in the same year the acquisition of 100 % shares of Mobil Solar. On September 1, 2001 ASE GmbH changed its name into RWE Solar GmbH and one year later on October 1st, 2002 the new joint venture RWE SCHOTT Solar was formed. Dr. Winfried Hoffmann serves as chairman of the Managing Board of RWE SCHOTT Solar and chairman of the Board of Directors of the US subsidiary RWE SCHOTT Solar, Inc.

He is a member of the Board of EPIA (European PV Industry Association) and of BSi (German Solar Industry Association), and a member of the scientific Board of the well-known scientific photovoltaic institutes Fraunhofer-ISE (Freiburg) and ISFH (Hannover/Hamel).n.

Technical Writing for Physical Scientists and Engineers

This course describes how to write clear, easy-to-follow, technical articles and reports that are appropriate for any given audience. Instruction progresses from the basic philosophy of communication and how this affects the core content and style of a document to article structure, paragraph construction, sentence construction, and use of vocabulary and punctuation. As well as teaching the basic rules of technical writing, this course explains the principles that underpin these rules. This deeper understanding will allow attendees to make more informed decisions about which elements of style they must follow, and to make better choices when faced with the many gray areas involved with technical writing. Finally, the course will help scientists and engineers to develop an eye for problems in their own writing and that of their colleagues.

LEARNING OUTCOMES

This course will enable you to:

- consider the audience at the beginning of the writing process, and use this knowledge to identify the appropriate content and level for the article
- use and design article structures that best relate the content in question
- construct paragraphs and sentences appropriately
- maximize information conveyed, and minimize reader boredom, by avoiding repetition
- consistently use the appropriate style, voice, and tense for a given document
- avoid hype, jargon, clichés, gibberish, mixed metaphors, and poor punctuation

INTENDED AUDIENCE

This course is intended for anyone who feels their writing needs improvement: from Ph.D. students to consulting engineers to professors. Reasonable fluency in English is required.

INSTRUCTOR

Sunny Bains is a scientist and journalist. She has been writing for the technical and popular science press, including *Laser Focus World*, *Electronic Engineering Times*, *New Scientist*, *Science*, and *The Economist*, for almost 15 years, edits six newsletters related to machine intelligence, imaging, and emerging computing technologies, and consults for the European Commission and the (UK) Engineering and Physical Sciences Research Council. Local Attractions and Sightseeing

The historic heart of Strasbourg is located in a curve of the Ill, a tributary of the Rhine. There is an impressive number of architectural treasures including massive medieval towers; neat, half-timbered houses; and prestigious town houses from the 18th Century concentrated in this perimeter of 83 hectares. The best way to tour the town is to stroll from one of the many very lively squares to the next. It is hard to get lost if you simply use the city's landmark, the gigantic silhouette of the cathedral, as a reference point. You should do the tour on foot, since Strasbourg is also the first city in France making a concerted effort to limit automobile traffic downtown with various measures. Through traffic is not permitted downtown, and more parking spaces have been provided on the periphery, while measures have been taken to encourage cooperation between the public transportation system, the futuristically designed tramway, bicyclists and pedestrians. But a visit of the city should not be limited to the downtown area, as picturesque as it might be. Be sure to see the European Quarter, a classic example of very contemporary architecture.

Get the latest editor-reviewed research . . . *much* faster!

You have options with your registration. Pick the one that best suits you.

Fastest: SPIE Digital Library Subscription

This option is for the serious researcher, where papers will now be available within 2 to 4 weeks after the meeting! You can choose 50 full-text downloads from more than 200,000 technical articles in the SPIE Digital Library covering the full breadth of optics and photonics research. This option takes research up a notch.

Faster: Printed Proceedings Volumes

If you are only interested in editor-reviewed papers from a single conference or want an archive of the conference that includes your paper, you can get the Yellow book faster than ever before; within six weeks of the meeting!

Fast: Searchable CD-ROMs with Multiple Conferences

Choose this option if you are interested in searching editor-reviewed papers from multiple conferences and a broad topical area. You can search for specific areas of interest. CD-ROMs are now available within 8 weeks of the meeting! You no longer have to wait a long, long time to have the added value of the CD-ROM.

SPIE Digital Library Subscription

For fastest access: editor-reviewed papers are available within 2 to 4 weeks of meeting.

The SPIE Digital Library is the world's largest resource available on optics and photonics. Researchers get unprecedented access to SPIE Proceedings and Journals from 1990 to the present—approximately 200,000 articles.

Researchers will save time because we make every aspect of locating the right information easier.

- 24/7 access, 365 days a year
- Browse proceedings tables of contents and abstracts by year, volume number, title, symposium, and technology area
- Email alerts for just published articles in your area of interest
- New content added frequently
- Powerful searching tools
- Citation meta data (BibTek, Endnote, Plaintext) available for easy download
- Create article collections for sharing and group collaboration
- Full-text papers in PDF and HTML (journals only)

ANNOUNCING TWO NEW JOURNALS

New in October 2006

New in January 2007

**nature
nanotechnology**

**nature
photonics**

Launching in October 2006, *Nature Nanotechnology* will provide a forum for the publication of top quality research, encompassing all aspects of nanotechnology where the core advancement being reported adds to the knowledge at the cutting edge of the field.

Aims and scope

Nature Nanotechnology will be defined by a lively mix of content of interest to physicists, chemists as well as materials and life scientists. In each monthly issue, in addition to carefully selected primary research articles, *Nature Nanotechnology* will provide a variety of information including editorials and commentaries, reviews, research highlights and news and views, which provide insights and analysis of the key advances reported within the broader literature.

Nanotechnology addresses the design, characterization, production and application of structures, devices and systems by the manipulation of materials at atomic, molecular and macromolecular scales.

Nature Nanotechnology will take a balanced approach to this field and will foster the exchange of ideas between scientists involved in different communities.

Each issue of *Nature Nanotechnology* will provide:

- **Research papers of the highest standard** — High quality, peer reviewed, authoritative research articles communicating the most significant findings to a broad multi-disciplinary readership
- **Reviews** — Top international researchers provide readers with a comprehensive overview of new developments in their field
- **Research Highlights** — Concise articles providing a summary of new research published in the wider literature
- **News and Views** — A detailed analysis of new research that is making the news
- **Commentary** — a forum for debate where experts discuss the implications of new developments in their field

Launching in January 2007, *Nature Photonics* will provide a unique forum for the publication of high quality research, encompassing all aspects of photonics and optoelectronics for scientists both in academia and industry.

Aims and scope

Nature Photonics will be a high profile peer reviewed journal committed to publishing the highest quality photonics and optoelectronics research covering all aspects of this dynamic field. *Nature Photonics* will offer news, reviews and commentary of the field alongside top-quality research papers both in print and online. The journal will be a key resource for chemists, physicists and materials scientists as well as engineers working in photonics and optoelectronics based both in academia and industry.

Photonics, including optoelectronics, addresses the fields of research dealing with all aspects of light creation, detection and manipulation as well as the interaction and combination of electronic and optical components. *Nature Photonics* will take a balanced approach to all these areas and its primary role will be to facilitate the flow of ideas to researchers in different communities.

Each issue of *Nature Photonics* will provide:

- **Research papers of the highest standard** — High quality, peer reviewed and authoritative research articles communicating the most significant findings to a broad multi-disciplinary readership
- **Reviews** — Top international researchers provide readers with a comprehensive overview of new developments in their field
- **Research Highlights** — Concise articles providing a summary of new research published in the wider literature
- **News and Views** — An in depth look at the wider issues of research making the news.
- **Commentary** — a forum for debate where experts discuss the implications of new developments in their field
